2. System Components

Item	Model	Description	
02	1"7150-313636TTT2	1" Flanged valve SS body c/w stem, Metso-Jamesbury	13
03A	837E-DA1BN1A1D4	Dual PNP programmable temperature switch, Allen Bradley	25
03B	TBR25-1	Thremo Well. Winters	31
03C	889D-F4AC-5	Cable, Allen Bradley	35
04	BM26A	Sight glass level indicator, Krohne	37
05A	50-EL42E-040-XCS	5" Thermometer c/w tilt head, Dresser-Aschcroft	49
05B	TW01-A12-L04	4" Well 1/2"npt inside, 3/4"npt outside, Mac-Weld	51
06	PAB.1730.10.5	Filler/breather filters, Parker	53
07	SL11	Tank magnet, Vescor	55
08A	75ml56300AD000HA0-ZY0	CLS Pointek level switch 450mm, Siemens	57
08B	75ml56300AD000HA0-ZY0	CLS Pointek level switch 300mm, Siemens	57
08C	75ml56300AD000HA0-ZY0	CLS Pointek level switch 120mm, Siemens	57
09	KV10F0T-28-A2	Volume compensator bladder, 38L, Parker	69
10A	1.5"9150313636TTT2	1.5" Flange valve SS body c/w stem, Metso-Jamesbury	73
10B	XCK-J...H7	Limit switch, Telemecanique	85
12A	F3CF2174WPE3-F9Y91	Suction filter, inlet on bottom, outlet on side, Parker	93
12B	926758	Check valve HS gas IL2, Parker	104
12C	XCK-J...H7	Limit switch, Telemecanique	85
13	PVP23362R2V21	Variable volume piston pump 11.1gpm 250-3600psi, Parker	107
14A	M400M4212	Standard motor pump coupling, Magnaloy	125

System Settings

Client: **GNA**

Project: **1394757-00 (100579-00)**

P.O.#: **00006518**

Delivery Date: **Feb. 07 2011**

Fittings:	Parker Triple-lok (37° Flare) Hamlet Tube Fitting
Paint:	Pneutech Standard Gray (Interlac 665 Alkyd Finish)
Motor:	ABB Motors 11kw(15hp) 1772rpm 460/3/60 Frame : 160M Model# : M3AA160MLA Full Load Amperage :18.2A Service Factor Full Load :20.0A
Pressure Setting:	131 Bars
Compensator Setting:	110 Bars
Flow Setting:	45.5 LPM
Recommended Oil Grade:	ISO 32
Maximum Operating Temp:	60 °C
Filter Element:	Suction Filter = F3CF274W = 924456 Pressure Filter = 30PD110Q = 932624Q Return Filter = DILP110Q = 937403Q

System Characteristics:

HINTS ON MAINTENANCE OF HYDRAULIC FLUID IN THE SYSTEM

HYDRAULIC FLUID CHANGES

Good maintenance procedures make it mandatory to keep the hydraulic fluid clean. A daily / weekly or monthly log should be kept on the hydraulic fluid condition.

No hard and fast rule can be established for changing the fluid because of the great variety of operating conditions. However, we do know that when filter elements are replaced frequently, service life of a system increases. Periodic testing of the fluid by the supplier is recommended to confirm suitability of the continued use and to establish the correct fluid and filter element replacement interval.

Some of the considerations affecting hydraulic fluid life are: operating temperature, type of service, contamination levels, filtration, and the chemical composition of the fluid.

FLUID RECOMMENDATIONS

Premium quality hydraulic oil with viscosity range between 150-250 SSU (30-50cst.) at 100°F (38°C).
Normal operating viscosity range between 80-1000 SSU (17-180cst.)
Maximum start-up viscosity is 4000 SSU (1000cst.)
NOTE: Consult Pneutech when exceeding 160°F operation. Oil should have maximum anti-wear properties, rust and oxidation treatment.

DRAINING THE SYSTEM

The system should be started and the fluid heated before draining. This will lower the time it takes to drain the system and allow impurities suspended in the fluid to be removed. It is desirable to remove all fluid from the system. Bleeding of the fluid at the lowest point in the system will help in most cases.

Systems that have accumulated deposits that were not removed during draining, must be flushed with a light viscosity fluid. The fluid should contain a rust inhibitor to protect metal surfaces against rust formation after draining.

When hydraulic fluid is added to replenish the system, it should be pumped through a 25-micron filter. If such a filter is not available, a funnel with a fine wire screen (200 mesh or finer) can be used. It is important that fluid can be clean and free of all substances, which will cause improper operation.

FLUID CONTAMINTAION / AERATION – CAUSES AND EFFECTS

CONTAMINATION

A contamination system can be the result of several factures: system design inadequate, poor maintenance of the system, poor housekeeping of the system and adverse operating conditions.

A. System inadequate

1. Reservoirs that cannot be cleaned.
2. Breather that permit abrasives, inherent in the atmosphere to enter the system.
3. Poor cylinder packing design (no wiper to clean dirt from the piston rod).
4. Improper piston rod design (piston rods with poor wear characteristics).
5. Improper valving (anti-cavitation checks omitted from cylinder circuits with rapid drop characteristics).
6. Failure to provide adequate filtration

B. Poor maintenance of the system

1. Improper and unclean practices when adding fluid to the system.
2. Failure to clean breathers
3. Failure to change pitted cylinder rods and worn cylinder packings.
4. Failure to use good cleanliness practices when changing system components.
5. Failure to change filter cartridges and/or fluid at proper intervals.
6. Failure to purge debris from the system after a pump failure.

C. Poor housekeeping of the system

Surgical cleanliness is not required, however, ordinary clean practices during assembly will pay off in increased service life of the equipment.

Excessive and improper use of pipe thread sealer on lines and gaskets in the system can cause pump failures. This is especially true when a type of sealer is used that hardens.

Another source of contamination is fittings, hoses and lines that are received from a vendor uncapped. The use of brazed or welded fittings and unpickled steel plating can also contribute to contamination.

D. Adverse Operating Conditions

From experience, we have found that machines used in a very dusty atmosphere and in windy areas require special components. For example, heavy-duty breather, chrome-plated piston rods, plus frequent changes of the filter cartridges are also required.

Effects of Contamination

Contamination affects all types of hydraulic equipment adversely. Precision high tolerance parts are very susceptible to the effects of contamination. Dirty fluid causes wear which accelerates leakage and the development of heat in a system. Heat lowers the lubricity of a hydraulic fluid and causes additional wear.

If a hydraulic pump or motor should fail, the system becomes contaminated: Remove the unit for repair. The reservoir must be drained flushed and cleaned. All hoses, lines, cylinders and valves should be inspected for wear and particles of the unit that failed. Flush all components of the complete system to remove metallic particles.

Replace filter elements. Dispose of the fluid removed from the system and fill the reservoir with clean hydraulic fluid. Install a new or rebuilt unit and start-up the system. Allow the system to run for a period of time to verify normal operation. Filter elements should be changed after 40 or 50 hours of operation. This guaranties that the system is essentially clean and free of any residue of the failed unit.

AERATION (air bubbles in the fluid)

Causes

The following are candidates for the formation of the air in a system.

A. Leaking inlet lines
B. Control valve "O" rings leaking.
C. Shaft seal leakage.
D. Leaking cylinder packings caused by cavitating cylinders.
E. Turbulence or sloshing in the reservoir.
F. Vortexing fluid in the reservoir
G. Release of air suspended within the fluid.

Effects

Aeration can be in many forms: large bubbles, foam or in various degrees of suspension. It usually causes pump noise (cavitation). Small bubbles causes extreme and rapid ring wear, with corresponding vane tip wear. Larger bubbles cause vanes to collapse and pound. This pounding effect develops rippling in the ring and the ring will have a dull appearance. This is more apparent on the straight vane rings that are hardened cast iron. With extreme aeration cases, the wear is so rapid that a ring contour at the pressure quadrant. When the step reaches a depth where the vane extends and locks, the vane and/or ring will break. Also, the shaft can break where it enters the rotor if the torque is great enough.

Cures

A. Leaking inlet lines

1. Pipe Threaded fittings can be porous. Use an approved type of pipe thread sealer on all pipe threads.
2. If the pump inlet flange surface is rough, scored or mutilated, air leakage past the "O" ring seal can result.

With any of the above defects, air can be pulled into the system.

B. Control valve “O” ring leaking

“O” rings are used to seal against port leakage in many control valves. These seals can be checked, by applying heavy grease around the part to be checked. If the noise stops, the trouble has been located and repair can be initiated.

On the systems that have been operating at excessive high temperatures, the “O” rings can harden and take a set. If this occurs, air leakage can result. This is true not only in a pump, but also in the rest of the components of the system. Another factor enhancing air leakage is the actual fluid composition. Fluids which have a high sulphur content tend to accelerate “O” ring hardness. This is one of the principle reasons for keeping system operating temperatures down. Normal operating temperature of a system is 90° above ambient. When operating temperatures are in excess of this value, trouble may result. Maximum operating temperatures should be checked at the pump outlet port.

C. Shaft seal leakage

Most vane pumps are internally drained. The shaft seal cavity is connected to the pump inlet. Excessively high inlet vacuums can cause air leakage at the shaft seal. The maximum vacuum measured at the pump inlet should not exceed five inches of mercury.

Shaft misalignment can increase the probability of air leakage past the shaft seal. Universal jointed couplings or splined couplings can cause seal leakage if not properly aligned. Straight (direct) coupling

The use of the wrong type of tools can cause distortion or mutilation of a shaft seal at installation. The outer diameter of the shaft should be lightly polished before installation to remove any burrs or roughness in the area of the shaft seal.

Shaft seals must be made of the correct material for a given application. A material that is not compatible with fluid can deteriorate and the result in a leakage problem.

D. Leaking cylinder packings caused by cavitating cylinders

On applications where a rapid raise and a lower cycle is experienced, air can enter the system through a cylinder rod seal. Vacuums, in excess of 20 inches of mercury, have been recorded in systems without anti-cavitation check valves. This is enough to force dirt particles past the shaft seal into the system with the air. An anti-cavitation check will allow flow from the reservoir to enter the rod area of the cylinder during a vacuum condition. Anti-cavitation checks should always be used to prevent a high vacuum condition from developing. This will lower the possibility of fluid contamination through the rod seal of a working cylinder.

E. Turbulence or sloshing in the reservoir

Return lines if improperly located, can cause turbulence and aeration. A plexiglass window should be placed in the prototype reservoir to study flow conditions. Return lines emptying above the fluid level cause bubbles to form in the system. Return lines should always be terminated below the fluid level. Vehicle movement can cause sloshing within the reservoir. The reservoir must be deep enough to prevent aeration.

F. Vortexing fluid in the reservoir

If the fluid level in the reservoir is low and the inlet demand is great, a vortex condition can develop that pulls air into the pump inlet. In a hydraulic system, vortexing is normally the result of low fluid or poor reservoir design.

One of the best ways of curing a vortex problem is to place an anti-cavitation plate over the outlet of the reservoir. This is a common piece of sheet metal at least 1/8 inch thick set over and above the outlet opening. This plate will allow flow into the outlet from a horizontal direction and effectively extends and enlarges the reservoir opening. This prevents the vortex condition from developing.

F. Release of air suspended within the fluid

There is considerable air suspended in cold hydraulic fluid. As the fluid warms, air is released into the system. A reduction of fluid pressure will also release air out of suspension. A simple relief valve poppet can create an orifice that increases velocity of the fluid and lowers its pressure. The reduced pressure condition releases air out of suspension into the system. Relief valves should be returned below the fluid level of the reservoir as far from the reservoir outlet as possible. This allows time for the air released by the relief valve to me removed before leaving the reservoir and entering the inlet area of the pump.

In some cases, special return line configurations are needed, or air bleed valves used, to remove air from the system.

A special baffle made of 60 meshes can be installed into the reservoir. This baffle should be positioned at a 30°angle in the reservoir, so that the inlet oil is above the screen and the outlet oil is below the screen. The top of the screen should be below the reservoir fluid level far enough to prevent surfaces foam from coming in contact with the screen. Surface foam can penetrate through the screen into the outlet area. The screen baffle will eliminate all bubbles except the very small ones from the fluid if designed properly.

TECHNICAL INFORMATION

Trouble-Shooting Guide and Maintenance Hints

Introduction

General

The trouble shooting charts and maintenance hints the follow are of a general system nature but should provide an intuitive feeling for a specific system. The more general information is covered in the immediately following paragraphs. Effect and probable cause charts appear on the following pages.

System design

There is of course, little point in discussing the design of a system that has been operating satisfactorily for a period of time. However, a seemingly uncomplicated procedure such as relocating a system or changing a component part can cause problems. Because of this, the following points should be considered:

A. Each component in the system must be compatible with and form and integral part of the system. For example, an inadequate size filter on the inlet of a pomp can cause cavitation and and subsequent damage to the pump.

B. All lines must be of proper size and free of restrictive bends. An undersized or restricted line results in a pressure drop in the line itself.

C. Some components must be mounted in a specific position with respect to other components or the lines. The housing of an in-line pump, for example, must remain filled with fluid to provide lubrication.

D. The inclusion of adequate test points for pressure readings, although not essential for operation, will expedite trouble-shooting.

Knowing the System

Probably the greatest aid to trouble-shooting is the confidence of knowing the system. The construction and operating characteristics of each one should be understood. For example, knowing that a solenoid controlled directional valve can be manually actuated will save considerable time in isolating a defective solenoid. Some additional practices that will increase your ability and also the useful life of the system follow:

A. Know the capabilities of the system. Each component in the system has a maximum rated speed, torque, or pressure. Loading the system beyond the specifications simply increases the possibility of failure.

B. Know the correct operating pressures. Always set and check pressures with a gauge. How else can you know if the operating pressure is above the maximum rating of the components? The question may arise as to what the correct operating pressure is. If it isn't correctly specified on the hydraulic schematic, the following rule should be applied: The correct operating pressure is the lowest pressure that will allow adequate performance of the system function and still remain below the maximum rating of the components and machine.

Once the correct pressures have been established, note them on the hydraulic schematic for future reference.

C. Know the proper signal levels, feedback levels, and dither and gain settings in servo control systems. If they aren't specified, check them when the system is functioning correctly and mark them on the schematic for future reference.

Developing systematic procedures

Analyze the system and develop a logical sequence for setting valves, mechanical stops, interlocks, and electrical controls. Tracing of flow paths can often be accomplished by listening for flow in the lines or feeling them for warmth. Develop a cause and effect trouble-shooting guide similar to the charts appearing on the following pages. The initial time spent on such a project could save hours of system, downtime.

Recognizing trouble indications

The ability to recognize trouble indications in a specific system is usually acquired with experience. However, a few general trouble indications can be discussed.

A. Excessive heat means trouble. A misaligned coupling places an excessive load on bearings and can be readily identified by the heat generated. A warmer than normal tank return line on a relief valve indicates operation at relief valve setting. Hydraulic fluids that have a low viscosity will increase the internal leakage of components resulting in a heat rise. Cavitation and slippage in a pump will also generate heat.

B. Excessive noise means wear, misalignment, cavitation or air in the fluid. Contaminated Fluid can cause a relief valve to stick and chatter. These noises may be the result of dirty filters, or fluid, high fluid viscosity, excessive drive speed, low reservoir level, loose intake lines, or worn couplings.

Maintenance

Three simple maintenance procedures have the greatest effect on hydraulic system performance, efficiency, and life. Yet, the very simplicity of them may be the reason they are so often overlooked. What are they?

Simply these:

A. Maintaining a clean sufficient quantity of hydraulic fluid of the proper type and viscosity.

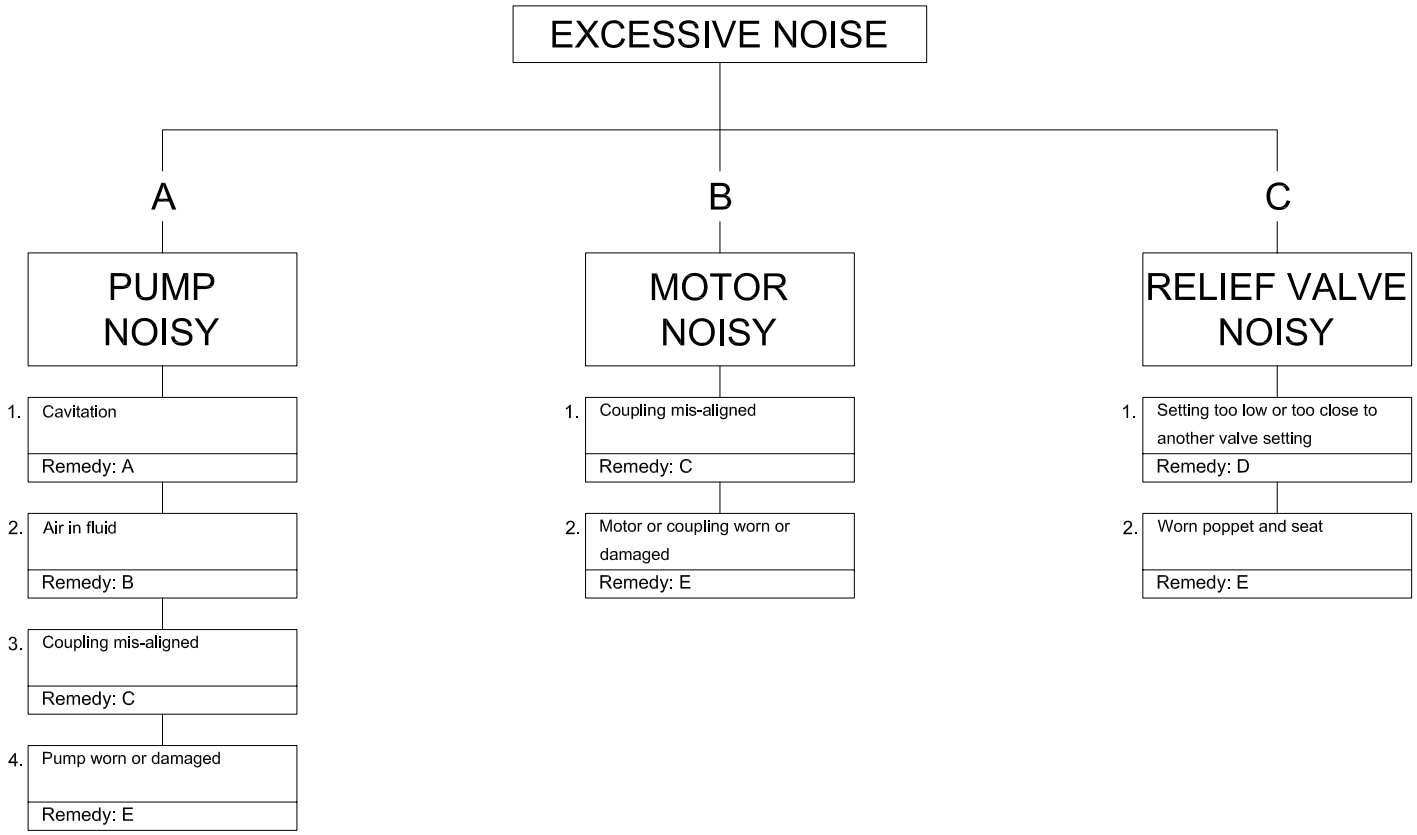
B. Changing filters and cleaning strainers.

C. Keeping all connections tight, but not to the point of distortion, so that air is excluded from the system

Trouble-shooting guides

The following charts are arranged in five main categories. The heading of each one is an effect that indicates a malfunction in the system. For example: if a pump is exceptionally noisy, refer to the chart 1 titled EXCESSIVE NOISE. The noisy pump appears in Column A under main heading. In column A there are four probable causes for a noisy pump. The causes are sequenced according to the ease of checking it. The first cause is cavitation and the remedy is "a". If the first cause does not exist, check for the cause number 2, etc.

CHART 1



REMEDIES:

- A - Any or all of the following:
  - Replace dirty filters.
  - Wash strainers in solvent compatible with system fluid.
  - Clean clogged inlet line.
  - Clean or replace reservoir breather vent.
  - Change system fluid.
  - Change to proper pump drive motor speed.
  - Overhaul or replace supercharge pump.
  - Fluid may be to cold.

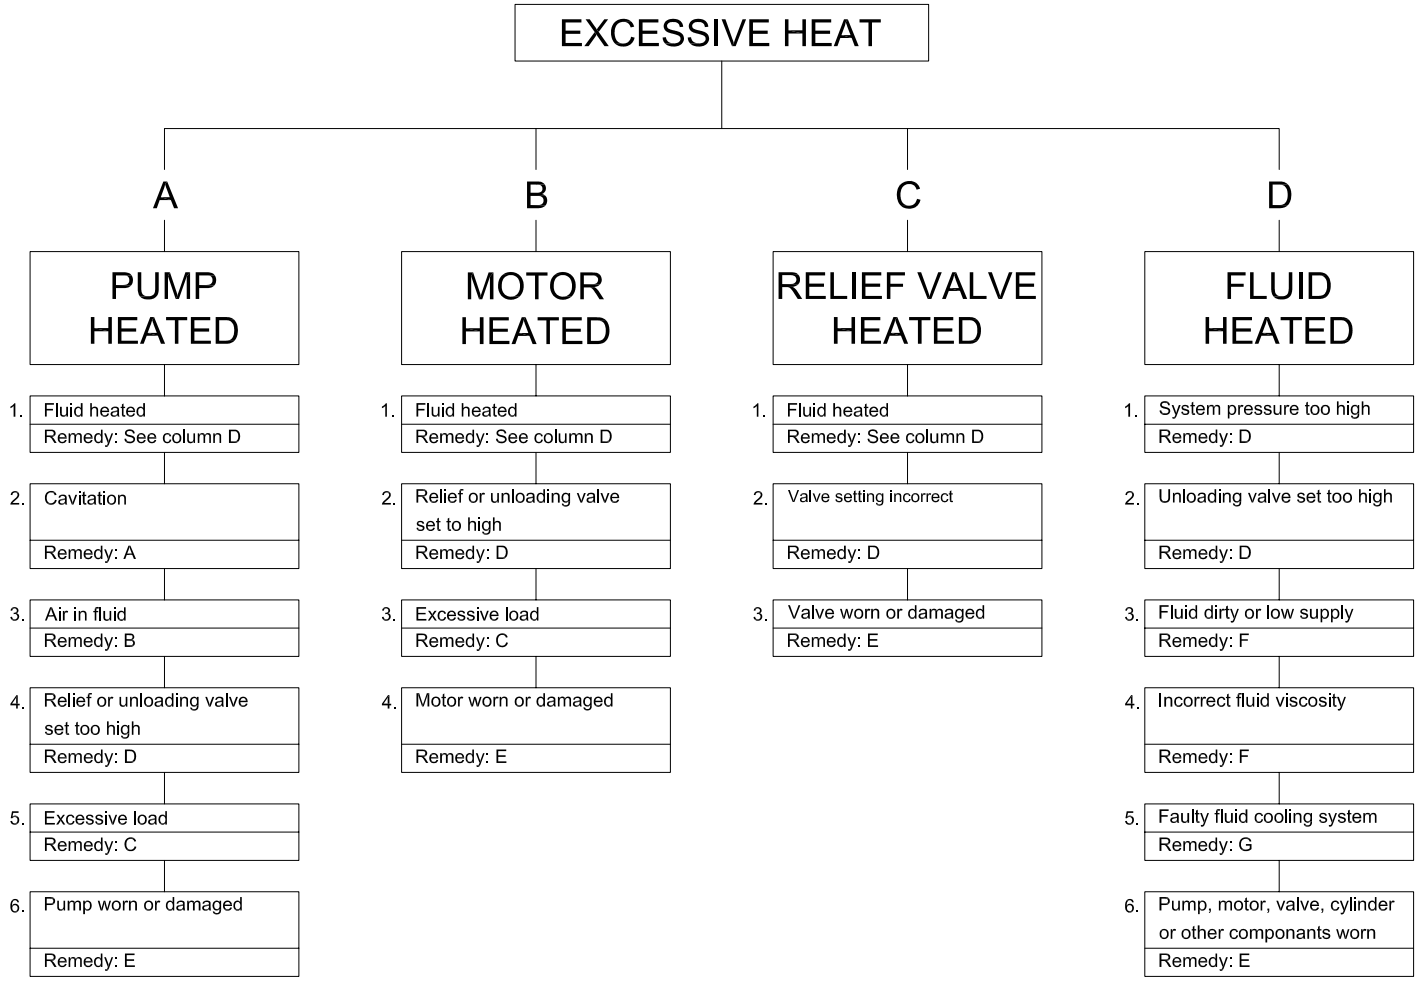
- B - Any or all of the following:
  - Tighten leaking connections.
  - Fill reservoir to proper level (with rare exeption all return lines should be below fluid level in reservoir).
  - Bleed air from system.
  - Replace pump shaft seal (and shaft if worn at seal journal).

- C - Align unit and check condition of seals, bearings and coupling.

- D - Install pressure gauge and adjust to correct pressure.

- E - Overhaul or replace.

CHART 2



REMEDIES:

- A - Any or all of the following:
  - Replace dirty filters.
  - Clean clogged inlet line.
  - Clean or replace reservoir breather vent.
  - Change system fluid.
  - Change to proper pump drive motor speed.
  - Overhaul or replace supercharge pump.

- B - Any or all of the following:
  - Tighten leaking connections.
  - Fill reservoir to proper level (with rare exeption all return lines should be below fluid level in reservoir).
  - Bleed air from system.
  - Replace pump shaft seal (and shaft if worn at seal journal).

- C - Any or all of the following:
  - Align unit and check condition of seals and bearings.
  - Locate and correct mechanical binding.
  - Check for work load in excess of circuit design.

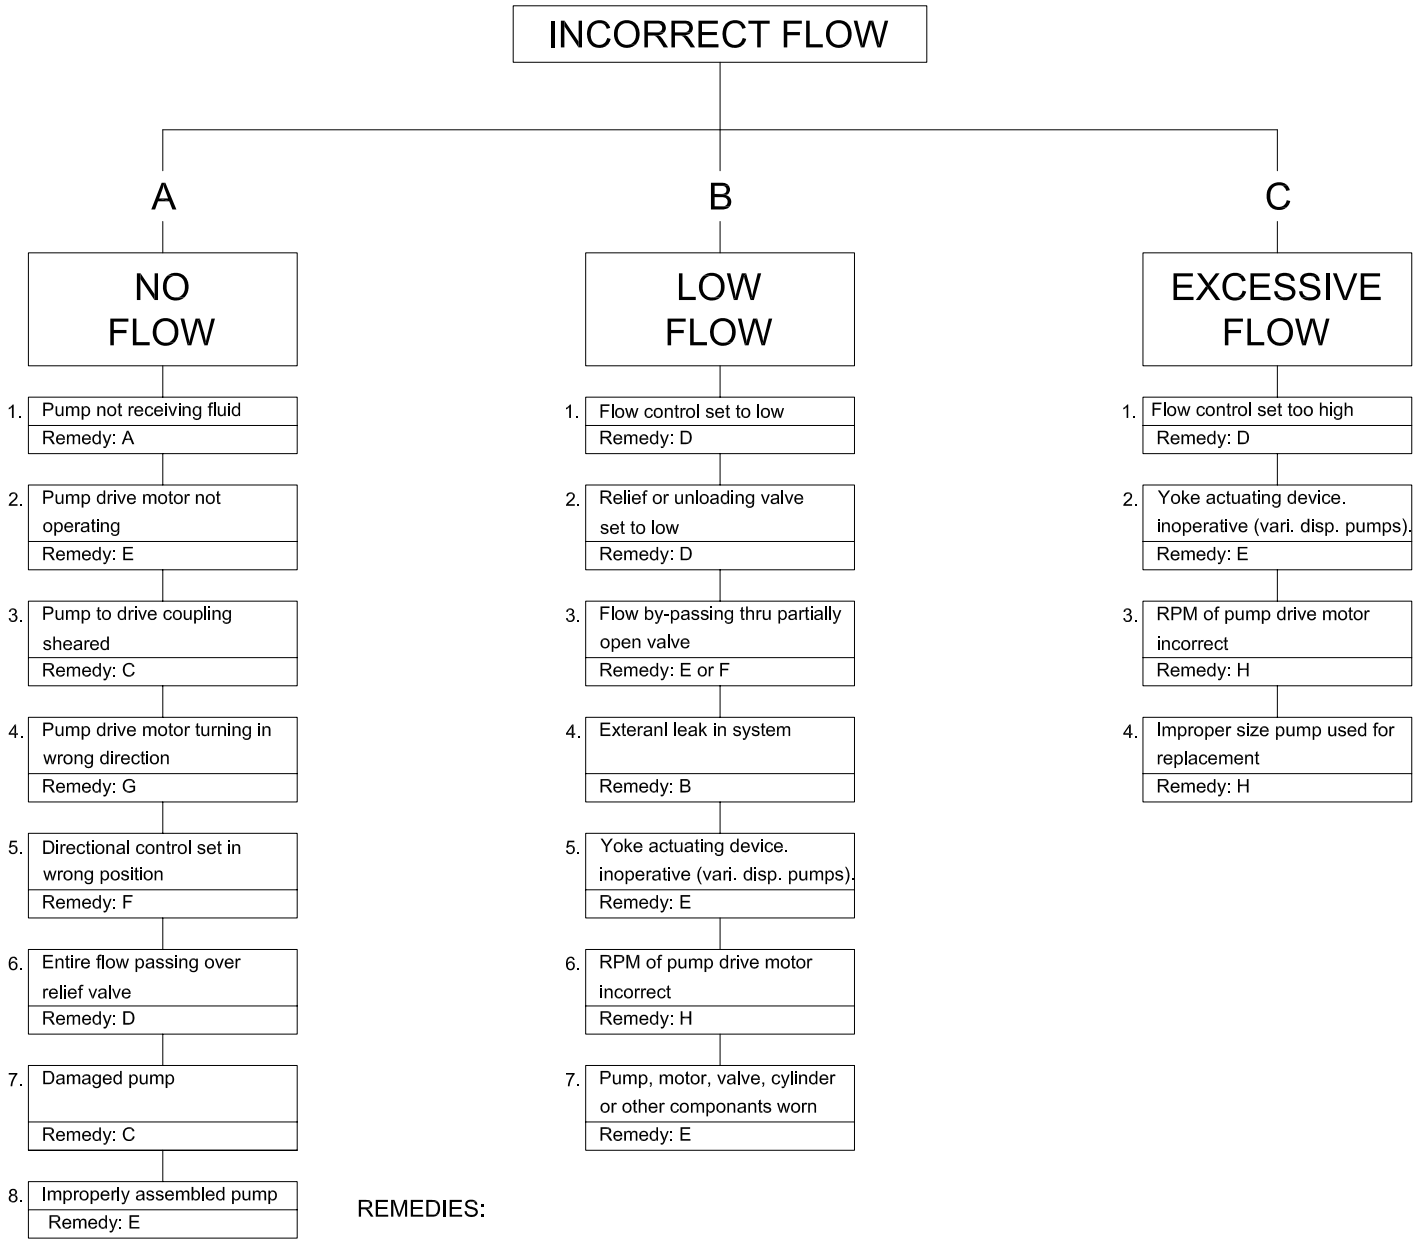
- D - Install pressure gauge and adjust to correct pressure. (Keep at least 125psi difference between valve settings).

- E - Overhaul or replace.

- F - Any or all of the following:
  - Change filters and also system fluid if of improper viscosity.
  - Fill reservoir to proper level.

- G - Any or all of the following:
  - Clean cooler and/or cooler strainer.
  - Replace cooler control valve.
  - Repair or replace cooler.

CHART 3



REMEDIES:

- A - Any or all of the following:
  - Replace dirty filters.
  - Clean clogged inlet line.
  - Clean or replace reservoir breather vent.
  - Fill reservoir to proper level.
  - Overhaul or replace supercharge pump.

- B - Tighten leaking connections.

- C - Any or all of the following:
  - Check for damaged pump or pump drive.
  - Replace and align coupling

- D - Adjust.

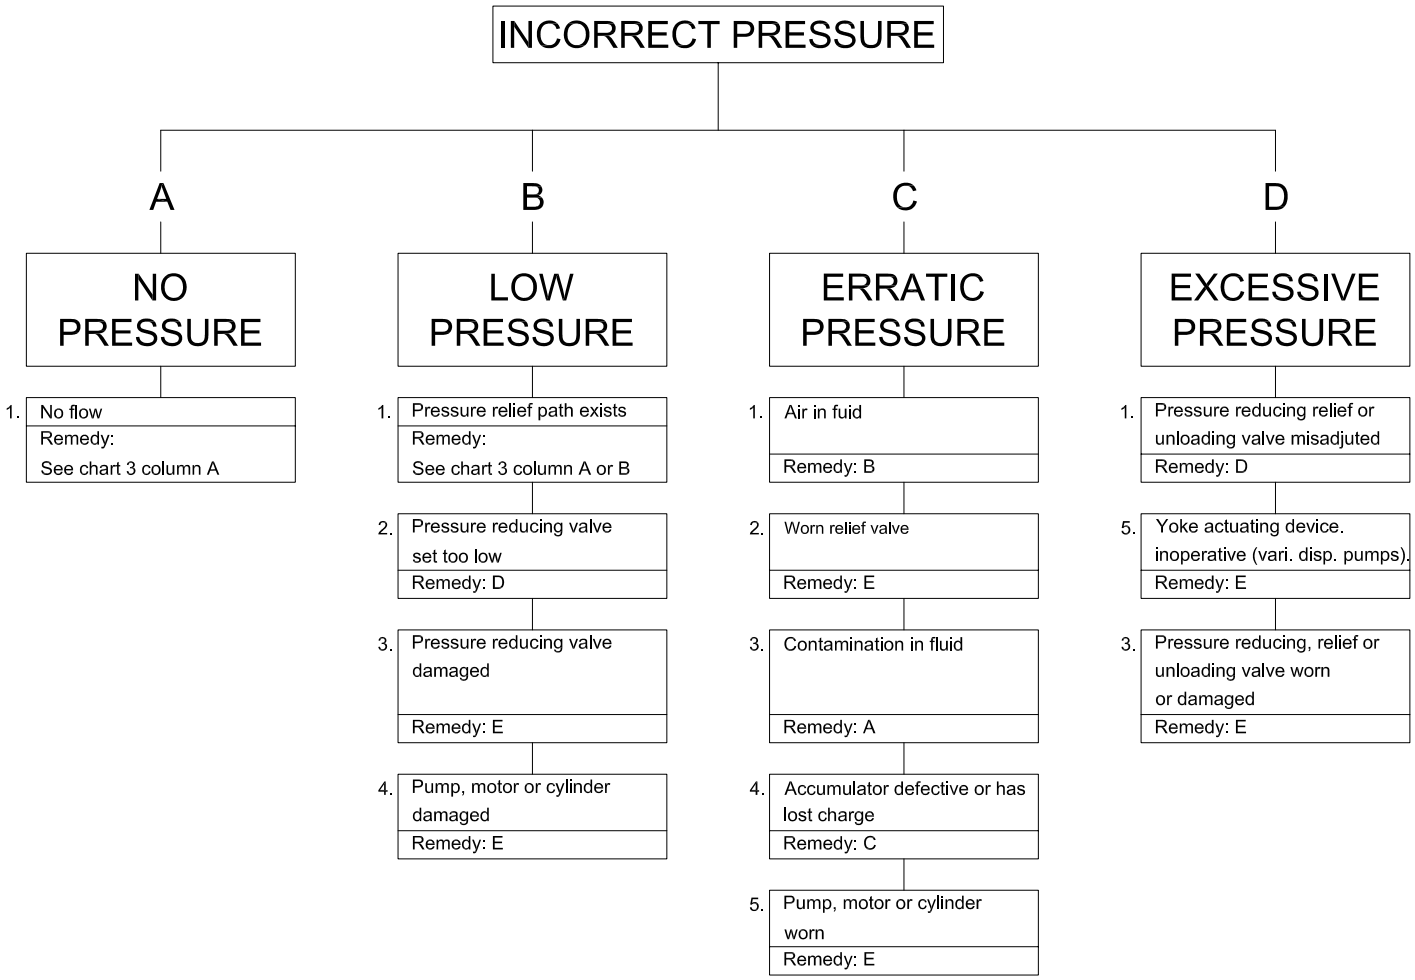
- E - Overhaul or replace.

- F - Any or all of the following:
  - Check position of manually operated controls
  - Check electrical circuit on solenoid operated controls
  - Repair or replace pilot pressure pump

- G - Reverse rotation

- H - Replace with correct unit

CHART 4



REMEDIES:

- A - Replace dirty filters and system fluid.

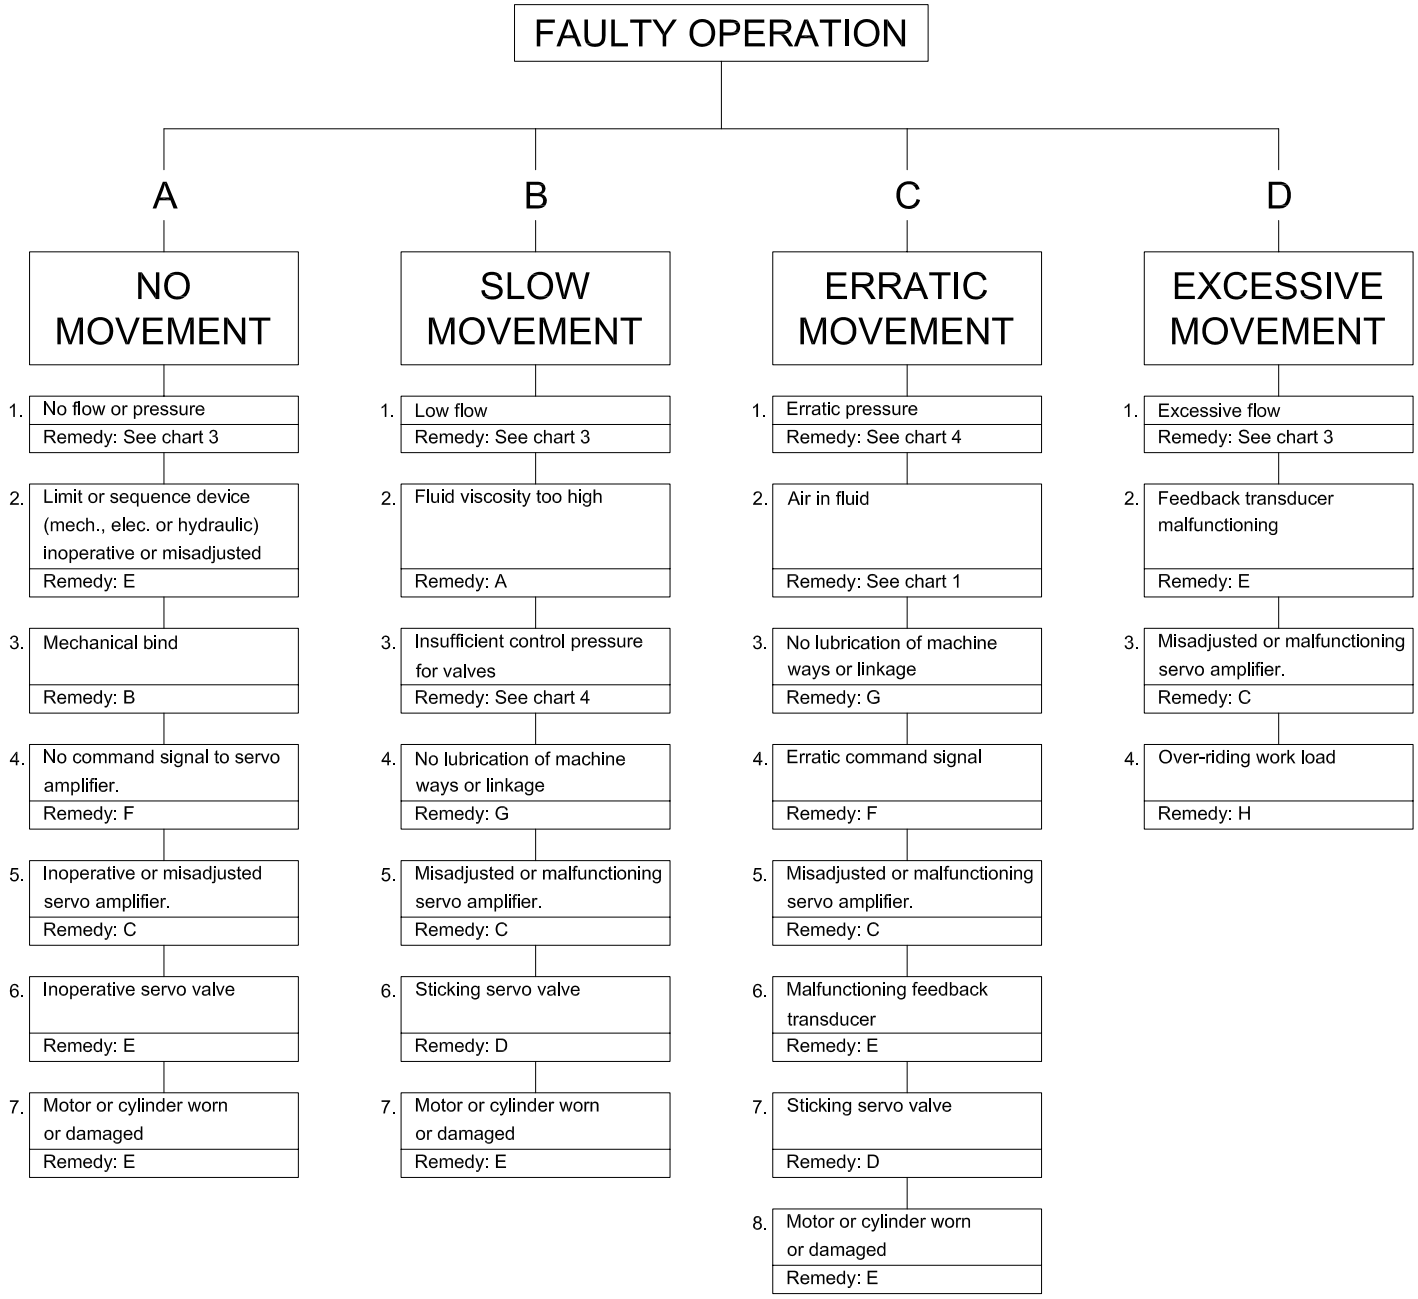
- B - Tighten leaking connections (fill reservoir to proper level and bleed air from system).

- C - Any or all of the following:
  - Check gas valve for leakage.
  - Charge to correct pressure.
  - Overhaul if defective

- D - Adjust.

- E - Overhaul or replace.

CHART 5



REMEDIES:

- A - Fluid may be to cold or should be changed to clean fluid of correct viscosity.

- B - Locate bind and repair.

- C - Adjust, repair or replace.

- D - Any or all of the following:
  - Clean and adjust or replace.
  - Check condition of system fluid and filters.

- E - Overhaul or replace.

- F - Repair command console or interconnecting wires.

- G - Lubricate.

- H - Adjust, repair or replace counterbalance valve.

FLANGED BALL VALVES ANSI CLASS 150 & 300

STANDARD BORE:

1/2" – 10" (DN 15 – 250) SERIES 7000
12" – 20" (DN 300 – 500) AND LARGER SERIES 5000

The JAMESBURY® polymeric-seated flanged ball valves offer a patented flexible-lip seat design that provides positive bi-directional shut-off for a variety of applications in industries ranging from chemical and petrochemical to refining, pulp and paper, and power.

Polymeric-seated flanged ball valves are available in sizes 1/2" – 24" (DN 15 – 600) in both full-bore and standard-bore designs that fully conform to ASME B16.34 requirements.

A choice of body, trim, and seat materials is available to suit an extensive range of applications. As an option, valves can be prepared for special services, such as chlorine, oxygen, high-vacuum, hydrogen peroxide or NACE.

FIRE-TITE® Valves

Standard body and trim materials for FIRE-TITE valves are carbon steel with 316 stainless steel trim and all 316 stainless steel. Seat material options are PTFE (T) and XTREME® (X) for applications involving chemicals, petrochemicals, acids, caustics, and steam. PFA (B) seats are available to resist the effects of polymerizing monomers such as butadiene and styrene.

Non FIRE-TITE Valves

Non FIRE-TITE valves are available with UHMW (U) polyethylene and Peek® (L) seats.

CE Marked

CE marked and documented valves 7180, 7380, 5180 and 5380 which meet the European Pressure Equipment Directive (PED) 97/23/EC are available in ANSI Class 150/300. CE marked products also meet the requirements of BS 5351. Operating torques, construction options and valve dimensions are exactly the same as the standard ANSI 150/300 offering. (See page 18) for ordering instructions.

FEATURES AND BENEFITS

- XTREME seat provides longer life, industry leading expanded performance boundaries, and greater value.
- Polymeric flexible lip-seat design offers tight shut-off in either direction and extended cycle life with minimum maintenance.
- FIRE-TITE version with non-metallic seats meets API 607, Edition 4, and BS6755-Part 2 requirements.
- Superior control characteristics, coupled with tight shut-off capabilities, make these valves ideal for a variety of on-off and control applications.
- API 608 compliance to serve refineries and related chemical and petrochemical industries.
- NACE MR0103 compliance available.
- Meets 23 standard and 7 optional industry standards and specifications. For details (see page 19).

NEW FEATURES AND BENEFITS
For 1/2" – 2" (DN 15 – 50) Series 7000

- New stem seal system is live loaded and engineered to assure long sealing life - patent pending.
- ISO 5211 Bonnet for global conformity.
- New stainless steel linkage for VPVL, ERV, ER and EU actuators has a guided coupling to align topworks during assembly and eliminate side load stress on stem seals for long life, clean environment and reduced maintenance.

Single-Source Responsibility

- Valves, actuators and accessories may be purchased completely mounted from one source.

metso
Expect results

SPECIFICATIONS

Flow Data

The table at right provides flow coefficients for JAMESBURY valves covered in this bulletin. C_v values represent the flow of water at +60˚F through the valve in U.S. gallons per minute at a pressure drop of 1 psi. The metric equivalent, K_v, is the flow of water at 16˚C through the valve in cubic meters per hour at a pressure drop of 1 kg/cm^2. To convert C_v to K_v, multiply by 0.8569.

Valve Body Ratings

These are the maximum working pressure ratings of the valve body only. The seat ratings, shown on the next page, determine the practical temperature and pressure limitations according to actual service conditions. Test pressures are recommended pressures for hydrostatic test with ball half open.

Valve Seat Ratings

Seat ratings, indicated by solid lines in the charts on the next page, are based on differential pressure with the valve ball in the fully closed position and refer to seats only. The dotted lines indicate maximum working pressures for *WCB carbon steel* valve bodies. (Maximum working pressures of other body materials are shown in the tables above.) The combination of dotted and solid lines indicates the maximum valve rating at specific pressure and temperature conditions. Valves with PTFE, XTREME, PEEK®, PFA, and UHMW polyethylene seats can be used in service to -60˚F (-51˚C) provided that the valve body material is suitable for such a temperature. Carbon steel valves are rated to -20˚F (-29˚C).

On saturated steam service, stainless steel trim is recommended at all pressures and is required above 200 psi (14 bar). See Bulletin B150-1. Peek seats require 17-4 PH stainless steel stems. For more application information on seat materials, refer to Bulletin T140-1.

XTREME Performance and Value

XTREME seats provide longer life, expanded performance boundaries, and the greatest possible value. XTREME is a unique material that resulted from a technological breakthrough in our polymer research lab. The material is a fluoropolymer-based blend proprietary to JAMESBURY that provides superior quarter-turn performance.

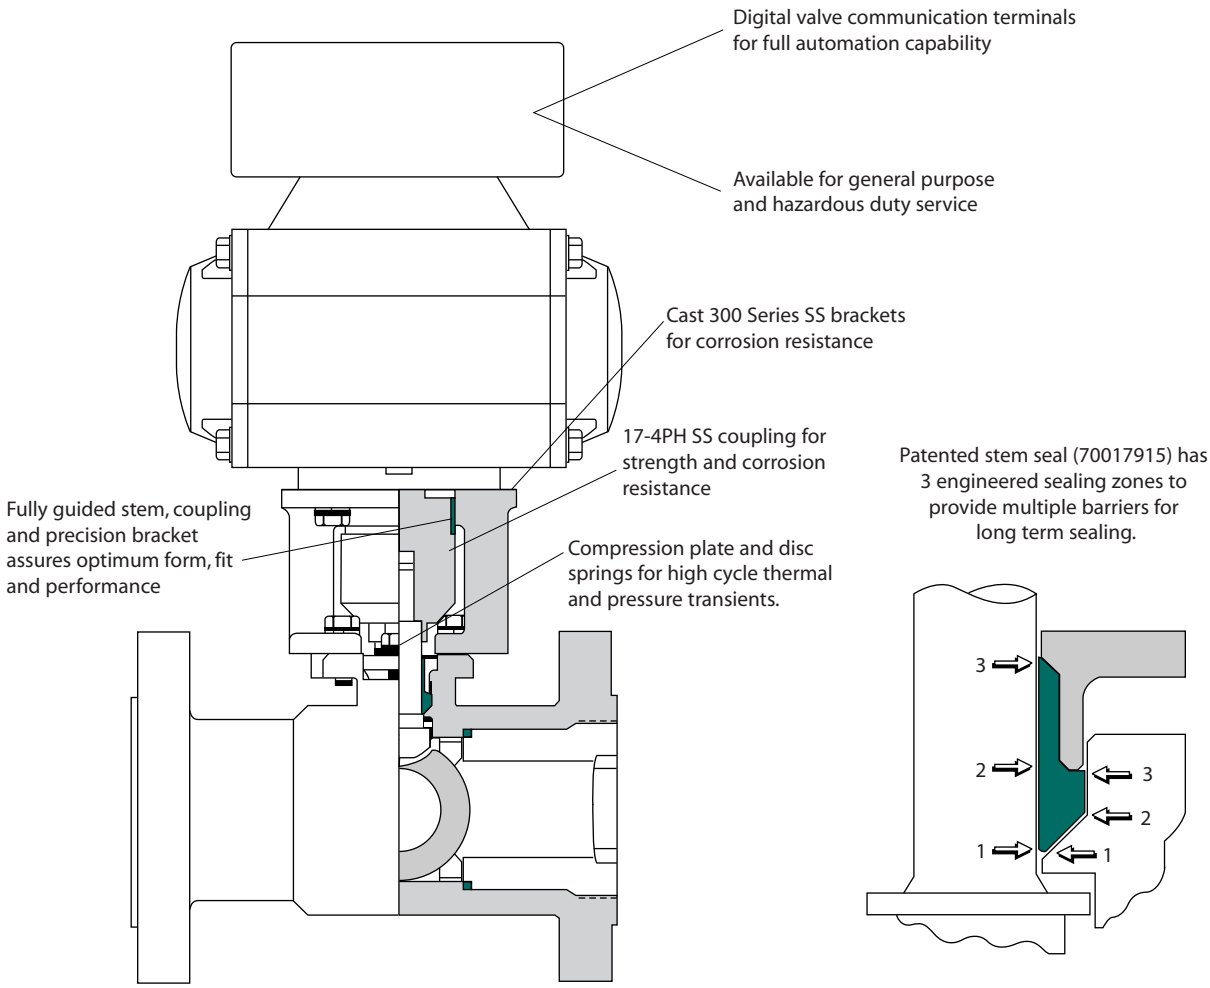
JAMESBURY 'The Ultimate Process Automation Package'
for VPVL Pneumatic Actuators, V-Series and ADC-Series Electric Actuators

For 1/2" – 2" (DN 15 – 50) Standard Port Series 7000



Automation Performance and Value

Valves combined with JAMESBURY actuators, network capable valve monitors and communication devices offer a total value and performance package. Available with pneumatic VALV-POWR VPVL actuators, V-Series and ADC-Series electric actuators and with STONEL® QUARTZ®, ECLIPSE®, and HAWKEYE® digital monitors or VCTs, the packages have a wide range of applications. Visit our website at **www.metso.com/automation**.

BILLS OF MATERIALS AND PARTS LIST

FIRE-TITE 1/2" – 2" (DN 15 – 50) Standard Port Series 7000 Valves

Part No.	Part Name	Body Material			
		Carbon Steel (22)	316 Stainless Steel (36)	Alloy 20 (35)	Monel (71)
1	Body	Carbon steel ASTM A216 Type WCB	316 Stainless steel ASTM A351 Type CF8M	Alloy 20 ASTM A351 Type CN7M	Monel ASTM A494 Type M35-1
2	Insert	Carbon steel ASTM A216 Type WCB	316L Stainless steel ASTM A351 Type CF8M	Alloy 20 ASTM A351 Type CN7M	Monel ASTM A494 Type M35-1
3	Ball	316 Stainless steel +, Monel, Hastelloy C		Alloy 20	Monel, Hastelloy C as specified
4	Stem	316 Stainless steel +, Monel, Hastelloy C		Alloy 20	Monel, Hastelloy C as specified
5	Seat	PTFE, XTREME, PFA			
6	Body Seal	TFM			
7	Secondary Stem Seal	Graphite			
8	Primary Stem Seal	PTFE, TFM® (XTREME-Seated Valves)			
13	Stem Bearing	Filled PTFE			
16	Hex Nut	Carbon steel (zinc plated)	300 Series Stainless steel		
17	Handle	Carbon steel (zinc plated)	300 Series Stainless steel		
19	Lock Washer	Carbon steel (zinc plated)	300 Series Stainless steel		
20	Compression Plate	316 Stainless steel			Monel
25	Socket Cap Screw	300 Series Stainless steel			
26	Handle Stop Spacer	300 Series Stainless steel			
29	Hex Cap Screw	300 Series Stainless steel (Monel if Chlorine or NACE)			Monel
31	Disc Springs	Inconel			

Non FIRE-TITE 1/2" – 2" (DN 15 – 50) Standard Port Series 7000 Valves

Part No.	Part Name	Body Material			
		Carbon Steel (22)	316 Stainless Steel (36)	Alloy 20 (35)	Monel (71)
1	Body	Carbon steel ASTM A216 Type WCB	316 Stainless steel ASTM A351 Type CF8M	Alloy 20 ASTM A351 Type CN7M	Monel ASTM A494 Type M35-1
2	Insert	Carbon steel ASTM A216 Type WCB	316L Stainless steel ASTM A351 Type CF8M	Alloy 20 ASTM A351 Type CN7M	Monel ASTM A494 Type M35-1
3	Ball	316 Stainless steel +, Monel, Hastelloy C		Alloy 20	Monel, Hastelloy C as specified
4	Stem	316 Stainless steel +, 17-4 PH Stainless steel 2, Monel, Hastelloy C		Alloy 20	Monel, Hastelloy C as specified
5	Seat	PTFE, Peek # & UHMWPE			
6	Body Seal	UHMWPE (w/UHMWPE seats), Graphite (w/Peek seats)			
8	Primary Stem Seal	Graphite (w/Peek seats), UHMWPE (w/UHMWPE seats)			
10	Stem Guide	Peek (Peek seated valves)			
16	Hex Nut	Carbon steel (zinc plated)	300 Series Stainless steel		
17	Handle	Carbon steel (zinc plated)	300 Series Stainless steel		
19	Lock Washer	Carbon steel (zinc plated)	300 Series Stainless steel		
20	Compression Plate	316 Stainless steel (Monel if Chlorine)			Monel
24	Stem Bearing	Filled PTFE (Peek when Peek-seated), (UHMWPE when UHMWPE-seated)			
25	Socket Cap Screw	300 Series Stainless steel			
26	Handle Stop Spacer	300 Series Stainless steel			
29	Hex Cap Screw	300 Series Stainless steel (Monel if Chlorine)			Monel
31	Disc Springs	Inconel			

Requires 17-4 PH stem

Note 1: When investment castings are used, chemical and physical properties are determined from a master heat in accordance with ASME/ANSI B16.34-1996 Sect. 5.1.2.

Note 2: 17-4 PH stems required with Peek seats

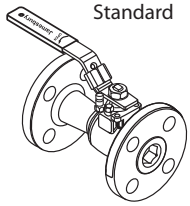
\+ Furnished with valves for NACE MR0103 service.

ACCESSORIES

Locking Devices

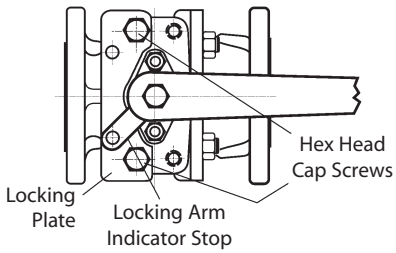
When safety measures are necessary, a reliable locking plate is available to allow the valve to be padlocked in either the open or closed position. Proper figure numbers are shown in the Accessory Table below.

Slide Lock
Standard



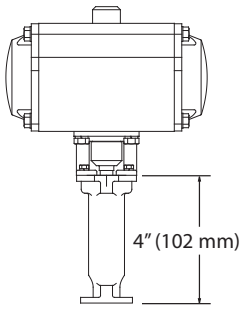
1/2" – 2" (DN 15 – 50)
Series 7000

3" – 8" (DN 80 – 200) Series 7150
3" – 6" (DN 80 – 150) Series 730S & 7300
LD56, 57 & 58



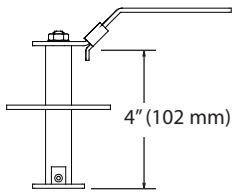
Bonnet/Stem Extensions SE-096, 097 & 098

4" (102 mm) bonnet/stem extensions are available for applications that require insulated pipe, particularly useful for automated products, extension can also be used to prevent interference between actuators and companion pipelines and equipment. They are ideal as extension that require locking lever or locking oval handle capability. Stainless steel construction offers the option of using the extension to complement the carbon steel stem extension (SE-093, 094 & 095) offerings.



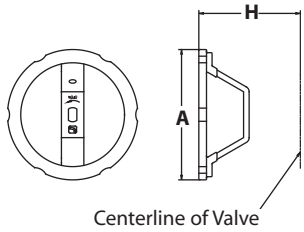
Stem Extensions SE-093, 094 & 095

A standard 4" (102 mm) stem extension is offered for Series 7000 valves (1/2 – 2") for improved accessibility, particularly when used in insulated pipelines. Stem extension kits can be ordered factory-mounted or shipped separately for field mounting



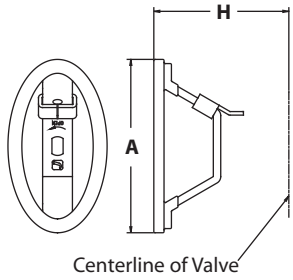
Round Handles

Series 7000 ball valves have optional round handles available. To order handles separately, specify the part number shown in the accessories table below.



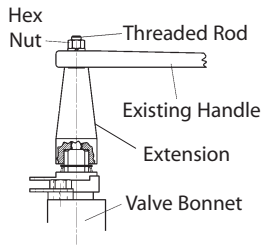
Oval handles with slide-lock

Optional oval handle saves space and may be padlocked to retain the valve in the open or closed position.



Stem Extensions SE-60, 61 & 62

A standard 4" (102 mm) stem extension is offered for Series 7000 valves (3 – 8") for improved accessibility, particularly when used in insulated pipelines. Stem extension kits can be ordered factory-mounted or shipped separately for field mounting



3" – 8" (DN 80 – 200) Series 7150
3" – 6" (DN 80 – 150) Series 730S & 7300

4 (100) 7150	LD56	SE-60							
4 (100) 730S & 7300	LD57	SE-61							
6 (150) 7150	LD57	SE-61							
6 (150) 730S & 7300	LD58	SE-62							
8 (200) 7150	LD58	SE-62							

* For valves with PEEK(L) seats use bonnet extension SE-096, 097 or 098.

VALVE TORQUE DATA

Use these torque charts as a guide for actuator selection. Additional requirements may be imposed by media characteristics, trim, and frequency of valve operation. For clean lubricating fluid service, required torque for PTFE (T), XTREME (X) and filled PTFE (M) seated valves only may be reduced 20% when the valve is equipped with corrosion resistant trim. For difficult services such as slurries and semi-solids, and for oxygen, increase values by 50%. If in doubt, err on the side of safety by using a larger actuator than would normally be selected.

Valves with E-PAK® require an increase in operating torque. Refer to Bulletin B115-4 for additional information.

Torque output values and actuator selection tables for the different types of JAMESBURY actuators are contained in the bulletins listed below.

Manual Gear Actuators	A100-1
B-Series Piston Actuators	6B20
QUADRA-POWR® X Spring Diaphragm Rotary Actuators	A110-4

837E Temperature Switches

Features

- Microprocessor based with no moving parts for longer life and reduced downtime
- Rugged, corrosion-resistant 316L stainless steel housing features an IP66 enclosure rating to withstand harsh industrial conditions
- Media temperature range from –50…150°C (–58…302°F)
- Operating temperatures from –40…85°C (–40…185°F)
- Industry-leading four-digit 14-segment digital display
- Independently programmable dual PNP N.O./N.C. outputs or 4…20 mA analog output with single PNP N.O./N.C. output
- Stainless steel probe

Specifications

Certifications	cULus, CE Marked for all applicable directives, and 3 A authorized only with sanitary adaptor
Supply Voltage	12…30V DC
Output	Dual PNP N.O./N.C. or 4…20 mA analog output with single PNP N.O./N.C.
Supply Current	<60 mA (no load)
Load Current, Max.	250 mA (per PNP output)
Analog Output Impedance	Max. (V_{supply} - 6.5V)/0.22 A
Accuracy	<0.2°C
Repeatability	<0.1°C
Temperature Drift	<0.1°C per year
Media Temperature [C (F)]	-50…150° (-58…302°)
Operating Temperature [C (F)]	-40…85° (-40…185°)
Housing Material	316 stainless steel
Wetted Parts	316L stainless steel
Enclosure Type Rating	IP66
Switch Cycles, Min.	>10,000,000
Response Time	Switch Output: ≤20 ms Analog Output: Rise Time: T_{90} ≤200 ms Analog Output: Settling Time: T_{99} ≤500 ms

Applications

- Automotive industry
- Machine tool
- Hydraulics
- Batch temperature control
- Food and beverage
- Pharmaceuticals

Sanitary Connectors

TBR Bi-Metal Threaded Thermowell

RoHS compliant

Description & Features:

- Available in a wide range of materials for use on most applications
- Standard “stepped construction” offering is complemented by an array of custom thermowells including: straight, tapered, sanitary and flanged configurations
- CRN registered
- 1 year warranty

Applications:

- Allows for the creation of a “sealed system”, whereby the thermometer can be removed from the application without the need for shutting down or draining the system
- To protect the thermometer from possible exposure to the process media

Specifications	
Thermometer Connection	½” NPT female connection standard Other thread sizes are available upon request
Process Connection	¾”, ½” or 1” NPT connection standard Other thread sizes are available upon request
Bore	0.260” (6.5mm) bore standard

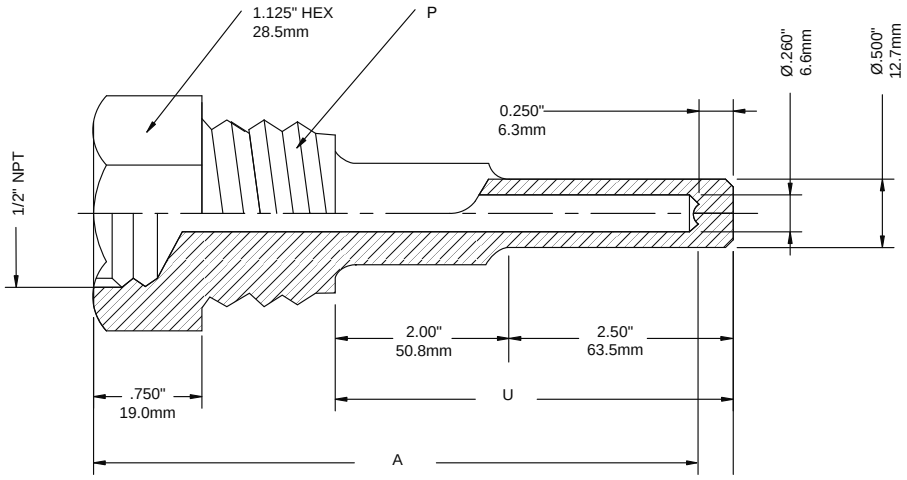
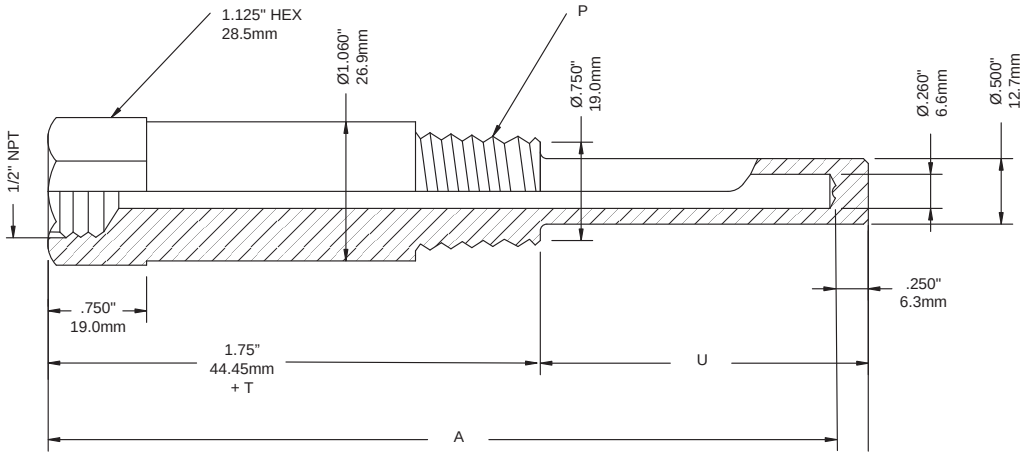
Standard Thermowell without lag



Standard Thermowell with lag



Cordsets & Patchcords, DC Micro Style

18 and 22 AWG, Yellow, Black, or Blue PVC

DC Micro Style

4-Pin DC Micro Cordset

Features

- Ratcheting coupling nut
- Subtle black or highly visible yellow PVC jacket offers good oil and chemical resistance
- Blue jacket models for intrinsically safe applications
- "–Q" models specifically wired for Quadroplex applications.
- "–V" models allow wiring of devices using pin 2 for output into standard single-point distribution boxes and IP 67 I/O

Specifications

Certifications	UL recognized and CSA certified
Mechanical	
Coupling Nut	Epoxy-Coated Zinc
Material	Molded oil-resistant PUR
Contacts	Gold over nickel-plated brass
Cable	Oil-resistant PVC jacket, 18AWG or 22AWG conductors, 300V, UL recognized and CSA certified
Bend Radius	10x diameter
Cable Diameter	2/c = 5 mm (0.21 in) 3/c = 5 mm (0.21 in) 4/c = 5 mm (0.21 in) 5/c = 6.5 mm (0.25 in) 4/c (18AWG) = 6.5 mm (0.25 in)
Electrical	
Cable Rating	UL AWM style 2661 VW–1 105C 300V, CSA AWM A/B I/II 80C 300V FT1, UV oil and water resistant
Assembly Rating	250V, 4 A
Environmental	
Enclosure Type Rating	IP 67, NEMA 6P, 1200 psi (8270 kPa) washdown
Operating Temperature—C (F)	–20…+105° (–4…+221°)

Pressure and temperature

Bypass-level indicator BM 26 A

- **Simple, rugged design**
- **Particularly suitable for use with highly corosive, noxious or flammable substances and ideal for severe operating conditions**
- **For Level or Interface measurement**

Operating principle

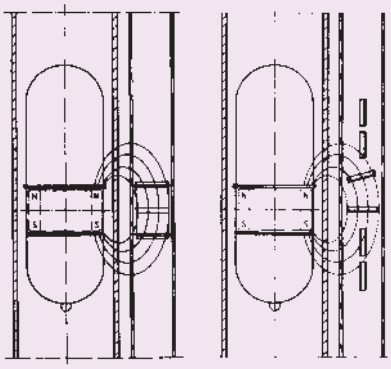
The BM 26 operates on the principle of communicating vessels. The measuring chamber is connected adjacent to the tank so that the same conditions are obtained in the chamber as those in the tank.

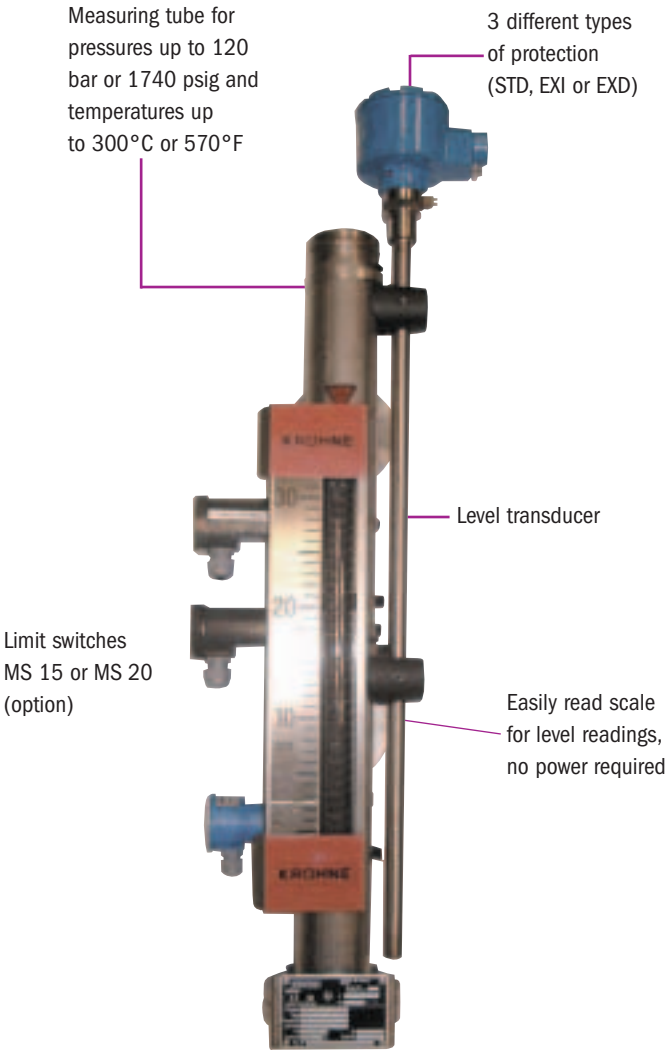
The float is equipped with a system of permanent magnets to transmit measured values to the local indicator.

The magnet system of the float activates either the magnetic flaps according to the liquid level, or a movable follower magnet in the indicating section of the indicator depending on the method of indication chosen.

The column of reversed yellow magnetic flaps, or the vertical position of the follower magnet, indicates the liquid level.

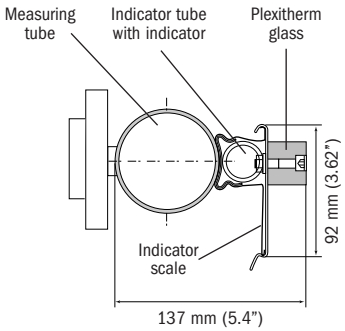
Standard indicator **Flap indicator**





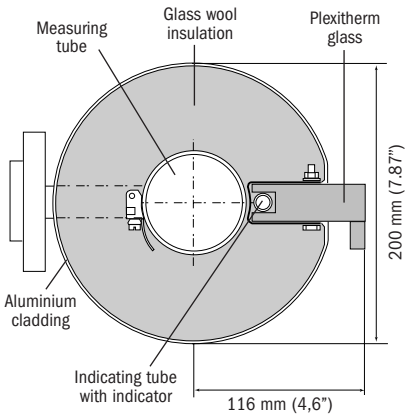
Special versions

BM 26 A/AG
down to –40°C or –40°F



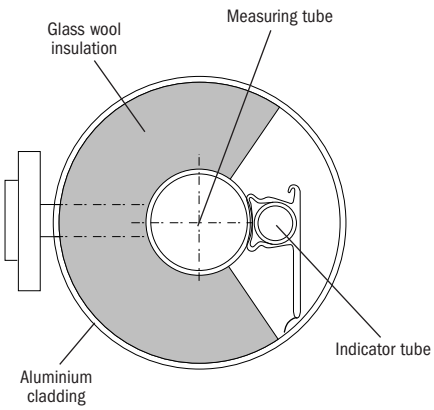
BM 26 A/TR, BM 26 A/IC/TR
down to –200°C or –330°F

BM 26 A/IC/TR is insulated.
BM 26 A/TR is ready for insulation by customer, please specify length of socket up to the connection flange.



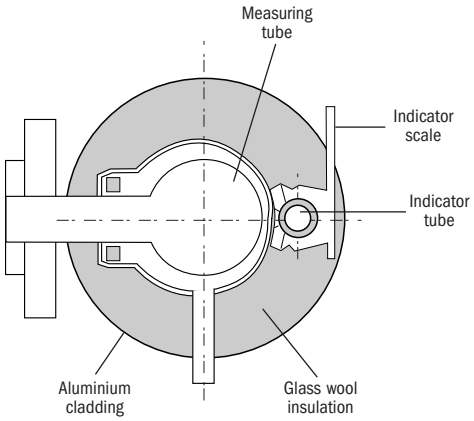
BM 26 A/HR, BM 26 A/IC/HR
for temperatures from -200 ... +300°C or -390 ... +570°F.

BM 26 A/IC/HR is insulated.
BM 26 A/HR is ready for insulation by customer, please specify length of socket up to the connection flange.



Heating system for measuring tube BM 26 A/B
For extreme operating conditions, the measuring tube is fitted with a heating jacket, standard connection Ermeto 12 for hot-water or steam heating.
Max. allowable operating pressure of the heating medium is 6 bar or 87 psig. Insulation of the measuring tube is recommended.

Section through measuring tube with heating jacket



The responsibility as to the suitability, intended use and corrosion-resistance of the materials used in their construction rests solely with the purchaser.

Technical data

Instrument type	**BM 26 A**
Measuring range (standard)	0.3 ... 6 m or 0.98 ... 19.68 ft
Accuracy	± 10 mm or ± 0.4" of measured value
Min. product density	0.5 kg/l ... 3.0 kg/l or 31.2 ... 187 lbs/ft^3
Viscosity	≤ 5000 mPa s or ≤ 3.360 lb/ft s
Max. allowable operating pressure at 20°C or 70°F (dependent on material, flange pressure rating and float pressure resistance)	40 bar or 580 psig; Information on higher pressure levels available on request
Indicator	
Standard	Linear indicator with cm/m graduation
Option	Linear scale with inch/feet, % or volume Graduation, as required; flap indicator without scale; flap indicator with scale in cm/m, inch/feet, % or volume graduation, as required
Mounting position	Vertical
Protection (indicator) to EN 60529	IP 68 (equivalent to NEMA 6)
Pressure vessel approvals	Pressure equipment directive 97/23/EC
Electromagnetic compatibility (EMC)	EN 50081-1, EN 50082-2 and EN 61326 (1 + 2)
Ambient temperature	
Standard, with flap or bar indicator	-20°C ... +200°C or –5 ... +390°F
Optional, non- Ex	-200°C ... +300°C or -325 ... +570°F

BM 26 A Bypass Level Indicator for all options, except those shown in tables below

Temperature class	Process temperature	Ambient temperature range for:
T6	T(fluid) ≤70°C or ≤160°F	-20...+60°C or –4...+140°F
T5	T(fluid) ≤95°C or ≤205°F	-20...+50°C or -4...+120°F
T4	T(fluid) ≤130°C or ≤265°F	-20...+50°C or -4...+120°F
T3	T(fluid) ≤195°C or ≤380°F	-20...+40°C or -4...+105°F

BM 26 A Bypass Level Indicator with level transducer PRETOP 5343B transmitter and / or all EXI – approved level switches

Temperature class	Process temperature	Ambient temperature range for:
T6	T(fluid) ≤70°C or ≤160°F	-40...+60°C or –40...+140°F
T5	T(fluid) ≤95°C or ≤205°F	-40...+50°C or -40...+120°F
T4	T(fluid) ≤130°C or ≤265°F	-40...+50°C or -40...+120°F
T3	T(fluid) ≤195°C or ≤380°F	-40...+40°C or -40...+105°F

BM 26 A Bypass Level Indicator without level transducer or level switch

Temperature class	Process temperature	Ambient temperature
T6	T(fluid) ≤70°C or 160°F	-20...+60°C or -4...+140°F
T5	T(fluid) ≤95°C or 205°F	-20...+50°C or -4...+120°F
T4	T(fluid) ≤130°C or 265°F	-20...+50°C or -4...+120°F
T3	T(fluid) ≤195°C or 380°F	-20...+40°C or -4...+105°F

Connecting flanges	
Standard	DN 25, PN 40 Form C (to DIN 2656)
Option	DN 15...DN 50, PN 16 or PN 40 or $^1/_2$"... 2", 150 lbs/RF or 300 lbs/RF
Connecting flanges for the heating jacket	
Screw joint (standard)	Ermeto 12; DN 15, PN 40 or $^1/_2$", 150 lbs/RF or 300 lbs/RF
Pipe	12 x 1 mm or 0.47" x 0.04"
Information on other standards and pressure ratings supplied on request	
Materials	See "Instrument versions"
Level transducer	
ER (reed chain)	Current output 4...20 mA
Limit switches MS 15; MS 20	Min. and max. contact

EL Series Bimetal Thermometers

FEATURES

- *Silicone liquid fill*
- *1% full span accuracy (ASME B40.3 Grade A)*
- *Maximum ambient temp. is 150°F (65°C)*
- *Hermetically sealed case to prevent entry of moisture, interior corrosion and coil freeze-up.*
- *External adjustment permits zero reset from outside the case.*
- *Maxivison® dial allows readability from any angle without parallax error.*
- *Silicone coil dampening (up to 400°F) provides vibration dampening and improves response time.*
- *All-welded stainless steel construction*
- *Durable polycarbonate window*
- *Protection IP 65*
- *Five year limited warranty*

MADE IN THE USA

SPECIFICATIONS

Ashcroft® Series:	EL
Dial Sizes:	3,″ 5″
Stem Length:	2½″–24″ (1)
Case & Stem:	304 stainless steel, hermetically sealed
Stem Dia:	.250″
Window:	Durable polycarbonate window
Dial:	Maxivision®, black figures on white background
Pointer:	Black
Connection:	½ NPT and ½ NPT union
Connection Location:	Everyangle, Rear
Ranges:	-40/160°F — 50/550°F -20/120°C — 0/300°C

Options:

Code	Description
C4	Individual calibration cert.
XCS	Dual scale
XDM	Dial marking
XNH	Stainless steel tag
XNN	Paper tag
X3B	⅜″ stem dia. with ½ NPT
X02	¼ NPT when ½ NPT is standard (2)
XS1	Silicone free

(1) Special or longer length available, consult factory
(2) Only available on rear connection

Thermowells must be used on all pressure or velocity applications, to protect the stem of thermometer from corrosion and physical damage, and to facilitate removal of the thermometer without disturbing the process. Maximum ambient temperature is 150°F (65°C).

HOW TO ORDER

30 EL 60 R 040 0/250°F XNH

Dial Size: 3″ Code 30
Case Style: EL
Stem Connection: ½ NPT Code 60
Stem Location: Rear Code R
Stem Length: 4″ Code 040
Range: Code 0/250°F
Options: Stainless steel tag

All specifications are subject to change without notice.
All sales subject to standard terms and conditions.

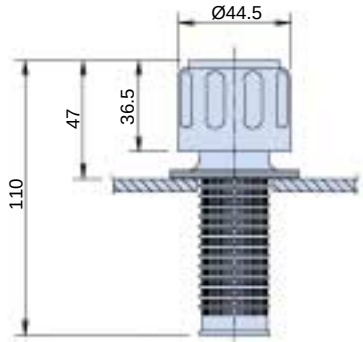
0.07 Kg.



TANK INSTALLATION NOTES

1. Un-pressurised 6 hole fixing
Form off tank mounting holes between Ø4.0 and Ø4.4 (dependant on the material and thickness, consult Parker Filtration) equispaced on 70.0-73.0 P.C.D. to suit No. 10 thread forming screws supplied.

2. Pressurised 6 hole fixing
Form 6 off mounting holes between Ø4.0 and Ø4.4 equispaced on 73.0 P.C.D. to suit
No. 10 thread forming screws supplied.

3. Un-pressurised 3 hole fixing
Form 3 off tank mounting holes between Ø4.0 and Ø4.4 equispaced on 41.3 P.C.D. to suit
No. 10 thread forming screws supplied.

TANK MAGNETS

Vescor Tank Magnets Pay Off For You because they pick-up material that ordinary filters miss. Tank Magnets help maintain clean oil. The cleaner the oil can be kept in your reservoirs, the less your troubles will be and the greater your savings will be.

REGULAR TANK MAGNETS – This Heavy Duty model uses 5/8" solid steel rod, furnished with a 5" support rod. However, these support rods can be ordered any length desired, either shorter or longer than 5" to suit the reservoir. Heavy Duty comes with the end threaded 5/8"-18 NF. The support rod can also be furnished with special threads or with special means of attachment brazed on. Pipe plugs are optional and are furnished in 2 1/2" NPT size. When a Tank-Magnet is ordered with a pipe plug, the unit is shipped assembled so all that is required is to unwrap it and screw it into position. The recommended opening that will accommodate the unit is a 2 1/2" pipe flange or a hole approximately 2 1/4" in diameter. If desired, it can be installed in the cover of any opening larger than this.

Construction – The magnetic unit of the Vescor® Tank Magnet is exceptionally efficient. Each section is composed of a larger doughnut shaped ceramic magnet and two disc shaped pole pieces. This unique design adds the area of the discs to the area of the magnets to give the greatest amount of magnetic surface possible. This design also permits the hydraulic fluid to flow in and around the magnets and discs, thus allowing the oil to come in intimate contact with the magnets and discs to facilitate the removal of ferrous particles.

SLIM LINE TANK MAGNETS consists of Alnico V Magnets encased in a non-magnetic tube with the major difference between it and regular tank magnet being that it is only 5/8" in diameter. This means that it can be put through a hole tapped for 3/4" pipe plug and can be used where mounting space is a premium. Slim Line Tank Magnets come in two types, the **Slim Line** and **Extra Sturdy Slim Line**, with standard aluminum or optional stainless steel housings. The aluminum housing series are numbered SL-11, etc. for the Slim Lines and SLX-11, etc. for the Extra Sturdy lines. To designate the stainless steel housing units, SS is added after the appropriate catalog number, i.e., SLX-13 SS.

Construction – **Magnetic units** - Basically the same for all types of Slim Lines, the magnetic units vary only in length. Support rods - All Slim Lines are normally furnished with a 5" long support rod, but can be furnished with any length, either longer or shorter than the standard 5" length. **Housing** - Slim Lines come with aluminum housing for use with ordinary hydraulic fluids. For use where conditions might cause problems such as water glycols or phosphate esters, a stainless steel housing is provided. **Mounting** - Pipe plugs for mounting in the reservoir top are optional and are furnished in any size from 3/4" NPT to 3" NPT, with a 1 1/4" NPT or larger being recommended. Units come completely assembled and ready for installation.

Application – For greatest protection - Use a size such, that the magnetic unit extends from 1" off the floor of the reservoir to the top of the oil level.

For lowest cost - Use a standard unit of any series for all sizes of reservoirs. Position it 1" from the bottom of the reservoir with proper length support rod.

No maintenance is needed except for periodic cleaning, with cleaning once a month recommended. To clean, remove from the reservoir, wipe with a clean cloth and reinstall.

WHICH ONE SHOULD I USE?

STANDARD

When . . .

- The support rod is short
- The magnetic unit is small
- Normal use can be expected
- Cost is important

HEAVY DUTY

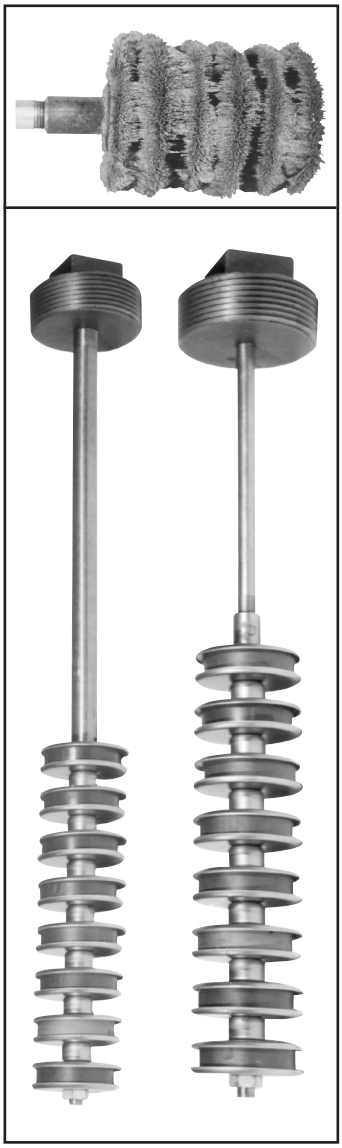
When . . .

- The support rod is long
- The magnetic unit is large
- Abuse in shipping or operation is expected
- A little more can be spent

CLEANING

Cleaning a Tank Magnet couldn't be easier. An ordinary air hose using shop compressed air does the job in seconds.

STANDARD MAGNETS



Cat. No. HDM-13 with 9" support rod and 2 1/2" pipe plug HEAVY DUTY

Cat. No. TM-14 with 5" support rod and 2 1/2" pipe plug STANDARD

WHEN ORDERING BE SURE TO:

- List number of the magnetic unit
- Give part number of plug (if plug is desired)
- Give length of support rod (if other than standard 5")
- Add SS to unit number if stainless steel housings are desired

Our experienced design engineers are available to give you quick and efficient help on any problems you may have with magnetic applications or with special designs.

Overview

Pointek CLS200 (standard version) is a versatile inverse frequency shift capacitance level switch with optional rod/cable choices and configurable output, ideal for detection of liquids, solids, slurries, foam and interfaces.

Benefits

- Potted construction protects signal circuit from shock, vibration, humidity and/or condensation
- High chemical resistance
- Level detection independent of tank or pipe earth reference
- Insensitive to product buildup due to high frequency oscillation
- 3 LED indicators for sensor status, output status, and power
- SIL/IEC61508 compliant for use in safety integrated level applications for overfill protection (SIL-2)

Application

Pointek CLS200 standard version has 3 LED indicators with basic relay and solid-state switch alarms.

The power supply is galvanically isolated and accepts a wide range of voltages (12 to 250 V AC/DC). When used with thermal isolator, the stainless steel and PPS (PVDF optional) materials used in the probe construction provide a temperature rating up to +125 °C (+257 °F) on the process wetted portion of the probe. The switch responds to any material with a dielectric constant of 1.5 or more by detecting a change in oscillating frequency, and it can be set to detect before contact or on contact with the probe. The CLS200 operates independently of the tank wall or pipe so it does not require an external reference electrode for level detection in a non-conductive vessel such as concrete or plastic.

- Key Applications: liquids, slurries, powders, granules, pressurized applications, hazardous areas

Configuration

Pointek CLS200 - Standard

Technical specifications

Mode of operation	
Measuring principle	Inverse frequency shift capacitive level detection
Input	
Measured variable	Change in picoFarad (pF)
Output	
Output signal	
• Relay output	1 SPDT Form C relay
- Max. contact voltage	• 30 V DC • 250 V AC
- Max. contact current	• 5 A (DC) • 8 A (AC)
- Max. switching capacity	150 W (DC) 2000 VA (AC)
- Time delay (ON and/or OFF)	1 to 60 s
• Solid-state output	
- Output	Galvanically isolated
- Protection	Against reversed polarity (bipolar)
- Max. switching voltage	• 30 V (DC) • 30 V peak (AC)
- Max. load current	82 mA
- Voltage drop	< 1 V, typical at 50 mA
- Time delay (pre or post switching)	1 to 60 s
Rated operating conditions[1]	
Installation conditions	
• Location	Indoor/outdoor
Ambient conditions	
• Ambient temperature	-40 to +85 °C (-40 to +185 °F)[2]
• Installation category	II
• Pollution degree	4
Medium conditions	Liquids, bulk solids, slurries and interfaces
• Relative dielectric constant ε_r	Min. 1.5
• Process temperature	
- Without thermal isolator	-40 to +85 °C (-40 to +185 °F)[2]
- With thermal isolator	-40 to +125 °C (-40 to +257 °F)
• Process pressure (rod version)	-1 to +25 bar g (-14.6 to +365 psi g) (nominal)
• Process pressure (cable version)[3]	-1 to +10 bar g (-14.6 to +150 psi g) (nominal)
• Process pressure (sliding coupling version)	-1 to +10 bar g (-14.6 to +150 psi g) (nominal)

Design	
• Material	
- Enclosure	Epoxy-coated aluminum with gasket
- Optional thermal isolator	316L stainless steel
• Connection	Removable terminal block, max. 2.5 mm²
• Degree of protection	IP65/Type 4/NEMA 4 (optional IP68)
• Cable inlet	2 x M20x1.5 thread (option: 2 x ½" NPT conduit entry including 1 plugged entry)
Power supply	12 to 250 V AC/DC, 0 to 60 Hz max. 2 W
Certificates and approvals	
• General Purpose	CSA, FM, CE, C-TICK
• Dust Ignition Proof	ATEX II 1/2 D T100°C
• Flameproof Enclosure With IS Probe	ATEX II 1 G EEx d[ia] IIC T6...T4 ATEX II 1/2 D T100°C
• Dust Ignition Proof With IS Probe	CSA/FM Class II, Div. 1, Gr. E, F, G CSA/FM Class III T4
• Explosion Proof Enclosure With IS Probe	CSA/FM Class I, Div. 1, Gr. A, B, C, D CSA/FM Class II, Div. 1, Gr. E, F, G CSA/FM Class III T4
• Marine	Lloyds Register of Shipping, Categories ENV1, ENV2 and ENV5
• Overfill Protection	WHG (Germany) VLAREM II
• Others	SIL/IEC61508 Declaration of Conformity [SIL-2 (overfill)] Pattern Approval (China)

1) When operation is in areas classified as hazardous, observe restrictions according to relevant certificate.
See also Pressure/Temperature curves on page 5/34.
2) Thermal isolator is used if process connection temperature exceeds +85 °C (+185 °F)
3) Pressure rating of process seal is temperature dependent.
See Pressure/Temperature curves on page 5/34.

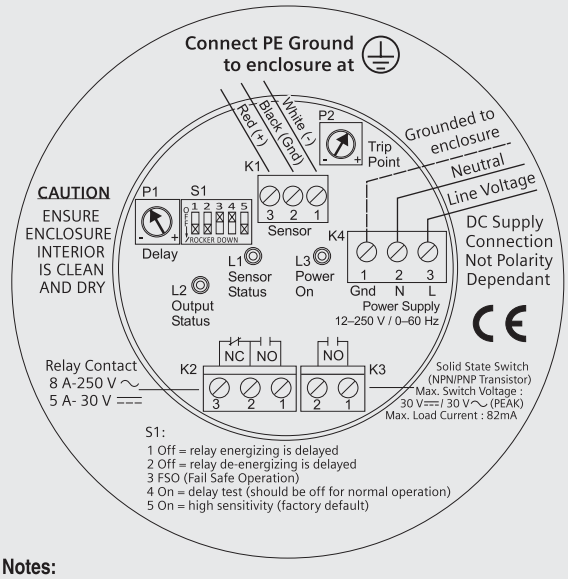
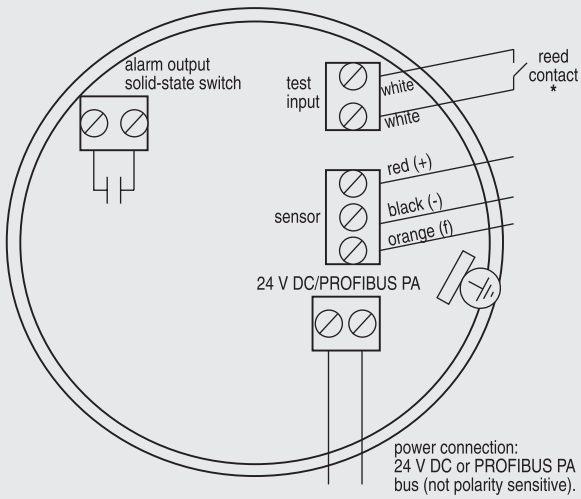
Schematics

Wiring: Pointek CLS200 Standard



Notes:
- Identification label is on underside of lid. Switch and Potentiometer settings are for illustration purposes only (Refer to Operation/Setup in manual).
- All field wiring must have insulation suitable for at least 250 V.
- Relay contact terminals are for use with equipment having no accessible live parts and wiring having insulation suitable for at least 250 V.
- Maximum working voltage between adjacent relay contacts shall be 250 V.
- Refer to the Instruction Manual or contact a Siemens representative for detailed wiring information.

Wiring: Pointek CLS200 Digital



Notes:
Refer to the Instruction Manual or contact a Siemens representative for detailed wiring information.

***Magnet Activated Sensor Test**
A magnet can be used to test the sensor without opening the lid of the Pointek CLS200 Digital version. Bring the magnet close to the test area indicated on the enclosure. The sensor test starts and finishes automatically after 10 seconds.

GREER
BLADDER PRODUCTS

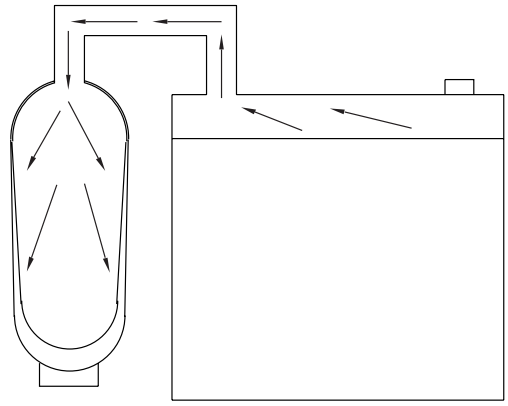
KleenVent KV Series

Hydraulic Reservoir Isolators

KleenVent Hydraulic Reservoir Isolators Feature:

- Capacities from 2-1/2 to 80 Gallons
- Four Bladder Polymers for a Wide Range of Fluids and Temperatures
- Fiberglas and Steel Shells
- Optional Pressure/Vacuum Breaker

Fluid contamination can lead to high maintenance costs and downtime in hydraulic systems. KleenVent reservoir isolators provide protection against the ingestion of airborne contaminants – dust, chemicals, and water vapor – into your hydraulic system though the reservoirs breather-vent. By using an elastomer bladder as a lung, the changes in gas volume in a hydraulic system's reservoir can be trapped and prevented from mixing with the outside atmosphere. And unlike conventional breather-vent filters, KleenVent reservoir isolators provide a positive separation without the possibility of clogging or need for maintenance.



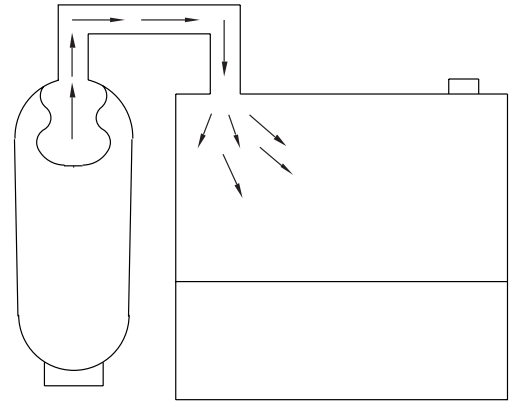
ATMOSPHERIC PRESSURE — RESERVOIR HIGH LEVEL

Why Use KleenVent Reservoir Isolators?

- reduce hydraulic system maintenance costs
- reduce hydraulic system downtime
- reduce waste disposal costs
- extends filter life
- low maintenance solution
- range of compounds for a variety of fluids

Greer KleenVent Reservoir Isolators – The Right Choice For . . .

- Steel/Primary Metal Mills
- Foundries
- Pulp and Paper Mills
- Power Generation Plants
- Automotive Plants
- Any Highly Contaminated or Humid Environment



ATMOSPHERIC PRESSURE — RESERVOIR LOW LEVEL

Specifications

Materials

- Shell – fiberglas or steel
- Ports – steel
- Bladders – choice of four compounds – Nitrile, Butyl, EPR, or Fluorocarbon, see chart below.

Pressure Ratings – Atmospheric pressure.

Fluids – Greer's KleenVent reservoir isolators are compatible with virtually any industrial fluid with the proper bladder selection. See chart below or consult factory.

Options – Pressure/Vacuum Breakers for safety and reservoir protection, see next page.

Seal Code	Polymer	Recommended Operating Temperature Range	Maximum Temperature with Reduced Life	General Application & Compatibility
01	Buna-Nitrile	-20°F to 200°F -29°C to 93°C	225°F 107°C	Greer's Standard Compound – Compatible with most mineral oil based fluids
06	Butyl	-40°F to 200°F -40°C to 93°C	300°F 149°C	Compatible with most phosphate ester fluids and some synthetic fluids
28	Fluorocarbon Elastomer	-10°F to 250°F -23°C to 121°C	400°F 204°C	Compatible with most mineral oil based fluids at higher temperatures and some exotic fluids
08	Ethylene Propylene	-40°F to 200°F -40°C to 93°C	300°F 149°C	Compatible with some synthetic fluids and water

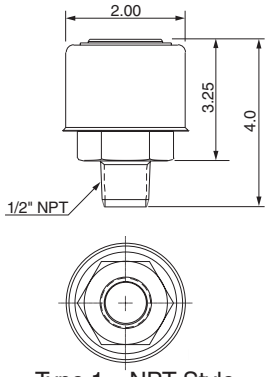
Optional Pressure/Vacuum Breaker

Greer recommends that every KleenVent installation be equipped with a Pressure/Vacuum Breaker to protect the reservoir in the event of a sudden fluid loss or over-filling. Greer offers two types of optional pressure/vacuum breakers, Type 1 that installs with a 1/2" male NPT, and Type 2 bayonet style that installs into your existing reservoirs fill-vent port.

Features & Specifications:

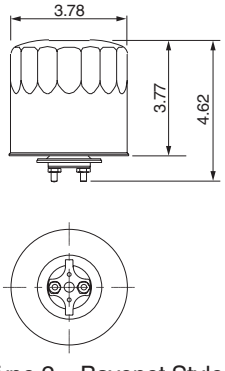
- Fixed pressure relief – 1 psid ± 0.5 psi (0.07 bar ± 0.035 bar)
- Fixed vacuum relief – 0.15 psid ± 0.15 psi (0.01 bar ± 0.01 bar)
- 10 micron filter – Type 1, reusable sintered bronze; Type 2, replaceable filter cartridge.

PN1486670000



Type 1 – NPT Style

PN1486680000



Type 2 – Bayonet Style

KleenVent Installation & Sizing Information

KleenVents should be installed when the reservoir is at its highest level. This will allow the bladder to deflate as the reservoir level drops. KleenVents should be installed in a vertical position for optimum performance. Multiple KleenVents should be installed in parallel when the required size exceeds 80 gallons. Always use “actual volumes” when sizing and select the next higher size when a capacity is required between size offerings.

Sizing a KleenVent on New and Existing Systems

On new systems, sum all single acting cylinder “differential” volumes (rod area x stroke) and all accumulator volumes in the system. Multiply this sum by 1.2 to find the KleenVent volume required. Select a KleenVent(s) with an actual capacity equal to or greater than the sum calculated. On existing systems, if the cylinder and accumulator sizes are known, the above method may be used. If not, calculate the total change in fluid volume in the system during operation by measuring the high and low fluid level of the reservoir. Multiply the difference in fluid levels by the width and length of the reservoir to calculate the total fluid volume change. Select a KleenVent(s) with an actual capacity equal to or greater than the sum calculated.

Installation Kits . . . Add Without Interruption

Add closed-loop protection without shutting down, purging the reservoir, contaminating existing fluids or losing time.

KleenVent Installation Kits

Part Number	Description
8708690006	Installation Kit with 6' hose
8708690009	Installation Kit with 9' hose
8708690012	Installation Kit with 12' hose

FLANGED BALL VALVES ANSI CLASS 150 & 300

FULL BORE:

1/2" – 12" (DN 15 – 300) SERIES 9000
14" – 24"(DN 350 – 600) AND LARGER SERIES 6000

The JAMESBURY® polymeric-seated flanged ball valves offer a patented flexible-lip seat design that provides positive bi-directional shut-off for a variety of applications in industries ranging from chemical and petrochemical to refining, pulp and paper, and power.

Polymeric-seated flanged ball valves are available in sizes 1/2" – 24" (DN 15 – 600) in both full-bore and standard-bore designs that fully conform to ASME B16.34 requirements.

A choice of body, trim, and seat materials is available to suit an extensive range of applications. As an option, valves can be prepared for special services, such as chlorine, oxygen, high-vacuum, hydrogen peroxide or NACE.

FIRE-TITE® Valves

Standard body and trim materials for FIRE-TITE valves are carbon steel with 316 stainless steel trim and all 316 stainless steel. Seat material options are PTFE (T) and XTREME® (X) for applications involving chemicals, petrochemicals, acids, caustics, and steam. PFA (B) seats are available to resist the effects of polymerizing monomers such as butadiene and styrene.

Non FIRE-TITE Valves

Non FIRE-TITE valves are available with UHMW (U) polyethylene and Peek® (L) seats.

CE Marked

CE marked and documented valves 9180, 9380, 6180 and 6380 which meet the European Pressure Equipment Directive (PED) 97/23/EC are available in ANSI Class 150/300. CE marked products also meet the requirements of BS 5351, including static grounding. Operating torques, construction options and valve dimensions are exactly the same as the standard ANSI 150/300 offering (see page 18 for ordering instructions).

FEATURES AND BENEFITS

- XTREME seat provides longer life, expanded performance boundaries, and greater value.
- Polymeric flexible lip-seat design offers tight shut-off in either direction and extended cycle life with minimum maintenance.
- FIRE-TITE version with non-metallic seats meets API 607, Edition 4, and BS6755-Part 2 requirements.
- Superior control characteristics, coupled with tight shut-off capabilities, make these valves ideal for a variety of on-off and control applications.
- API 608 compliance to serve refineries and related chemical and petrochemical industries.
- NACE MR0103 compliance available.
- Meets 23 standard and 7 optional industry standards and specifications. For details (see page 19).

NEW FEATURES AND BENEFITS
For 1/2" – 1-1/2" (DN 15 – 40) Series 9000

- New stem seal system is live loaded and engineered to assure long sealing life - patent pending.
- ISO 5211 Bonnet for global conformity.
- New stainless steel linkage for VPVL, ERV, ER and EU actuators has a guided coupling to align topworks during assembly and eliminate side load stress on stem seals for long life, clean environment and reduced maintenance.

Single-Source Responsibility

- Valves, actuators and accessories may be purchased completely mounted from one source.

SPECIFICATIONS

Flow Data

The table at right provides flow coefficients for JAMESBURY valves covered in this bulletin. C_v values represent the flow of water at +60˚F through the valve in U.S. gallons per minute at a pressure drop of 1 psi. The metric equivalent, K_v, is the flow of water at 16˚C through the valve in cubic meters per hour at a pressure drop of 1 kg/cm^2. To convert C_v to K_v, multiply by 0.8569.

Valve Size		Cv
Inches	DN	Full Bore
1/2	15	9
3/4	20	50
1	25	100
1-1/2	40	270
2	50	490
3	80	1160
4	100	2200
6	150	5100
8	200	9300
10	250	15,200
12	300	22,400
14	350	27,000
16	400	37,000
18	450	47,000
20	500	60,000

Valve Body Ratings

These are the maximum working pressure ratings of the valve body only. The seat ratings, shown on the next page, determine the practical temperature and pressure limitations according to actual service conditions. Test pressures are recommended pressures for hydrostatic test with ball half open.

Maximum Working Pressure, psi						
Temp ˚F	Class 150				Class 300	
	Carbon steel*	316 Stainless steel*	Alloy 20*	Monel®	Carbon steel*	316 Stainless steel*
-20 to 100	285	275	230	230	740	720
200	260	235	200	200	675	620
300	230	215	190	190	655	560
400	200	195	190	185	635	515
500	170	170	170	170	600	480
Test Pressure	450	425	350	350	1125	1100

Maximum Working Pressure, bar

* In accordance with ANSI B16.34

Valve Seat Ratings

Seat ratings, indicated by solid lines in the charts on the next page, are based on differential pressure with the valve ball in the fully closed position and refer to seats only. The dotted lines indicate maximum working pressures for *WCB carbon steel* valve bodies. (Maximum working pressures of other body materials are shown in the tables above.) The combination of dotted and solid lines indicates the maximum valve rating at specific pressure and temperature conditions. Valves with PTFE, XTREME, PEEK®, PFA, and UHMW polyethylene seats can be used in service to -60˚F (-51˚C) provided that the valve body material is suitable for such a temperature. Carbon steel valves are rated to -20˚F (-29˚C).

On saturated steam service, stainless steel trim is recommended at all pressures and is required above 200 psi (14 bar). See Bulletin B150-1. Peek seats require 17-4 PH stainless steel stems. For more application information on seat materials, refer to Bulletin T140-1.

XTREME Performance and Value

XTREME seats provide longer life, expanded performance boundaries, and the greatest possible value. XTREME is a unique material that resulted from a technological breakthrough in our polymer research lab. The material is a fluoropolymer-based blend proprietary to JAMESBURY that provides superior quarter-turn performance.

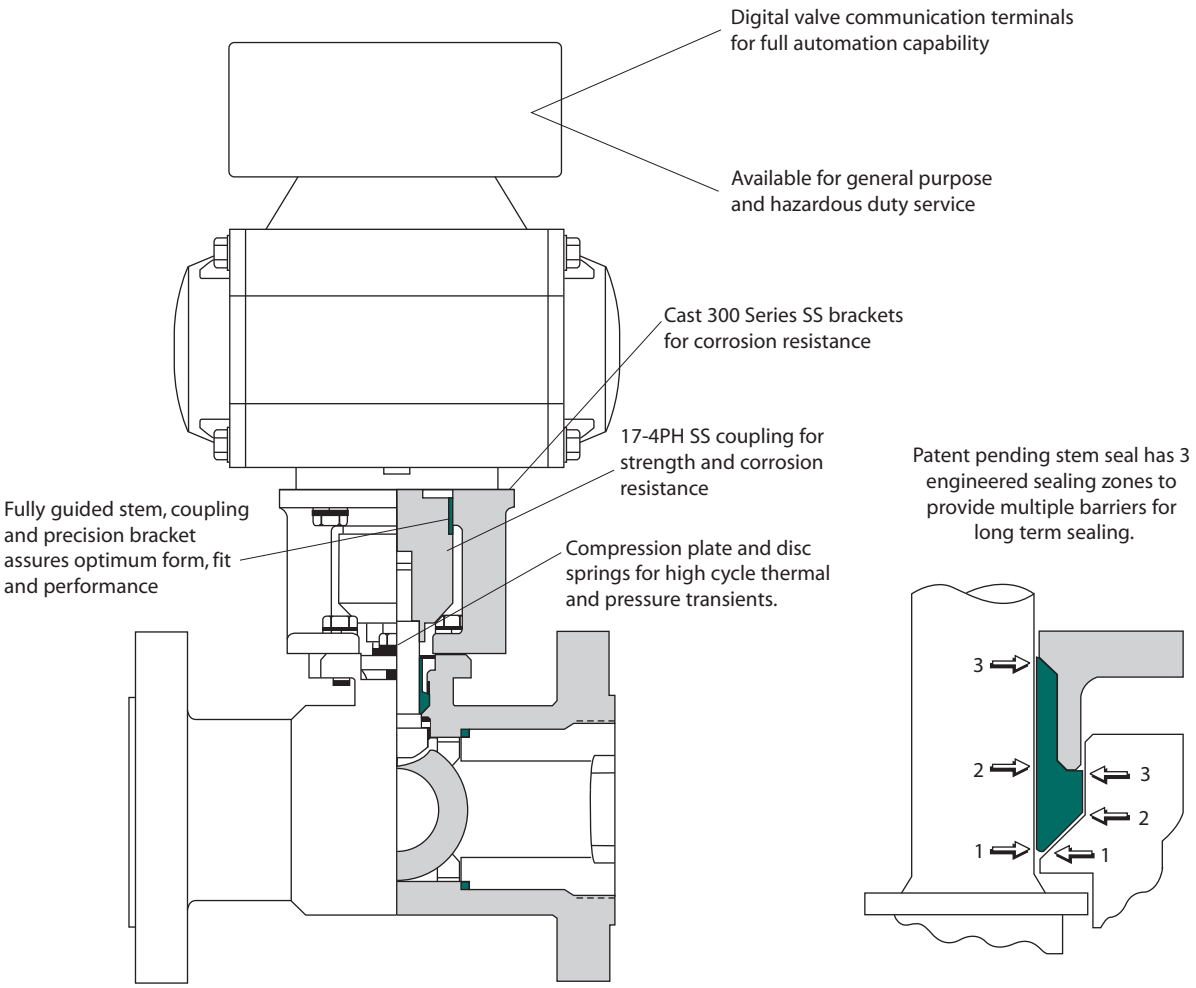
JAMESBURY 'The Ultimate Process Automation Package'
for VPVL Pneumatic Actuators, V-Series and ADC-Series Electric Actuators

For 1/2" – 1-1/2" (DN 15 – 40) Full Port Series 9000



Automation Performance and Value

Valves combined with JAMESBURY actuators, network capable valve monitors and communication devices offer a total value and performance package. Available with pneumatic VALV-POWR® VPVL actuators, V-Series and ADC-Series electric actuators and with STONEL® QUARTZ®, ECLIPSE®, and HAWKEYE® digital monitors or VCTs, the packages have a wide range of applications. Visit our web-site at **www.metso.com/automation**.

BILLS OF MATERIALS AND PARTS LIST

FIRE-TITE 1/2" – 1-1/2" (DN 15 – 40) Full Bore Series 9000 Valves

Part No.	Part Name	Body Material	
		Carbon Steel (22)	316 Stainless Steel (36)
1	Body	Carbon steel ASTM A216 Type WCB	316 Stainless steel ASTM A351 Type CF8M
2	Insert	Carbon steel ASTM A216 Type WCB	316L Stainless steel ASTM A351 Type CF3M
3	Ball	316 Stainless steel +	
4	Stem	316 Stainless steel +	
5	Seat	PTFE, XTREME, PFA, as specified	
6	Body Seal	TFM	
7	Secondary Stem Seal	Graphite	
8	Primary Stem Seal	PTFE, TFM (XTREME seated valves), UHMWPE (w/UHMWPE seats)	
13	Stem Bearing	Filled PTFE	
16	Hex Nut	Carbon steel (zinc plated)	300 Series Stainless steel
17	Handle	Carbon steel (zinc plated)	300 Series Stainless steel
19	Lockwasher	Carbon steel (zinc plated)	300 Series Stainless steel
20	Compression Plate [3]	316 Stainless steel	
25	Socket Cap Screw	300 Series Stainless steel	
26	Handle Stop Spacer	300 Series Stainless steel	
29	Hex Cap Screw [3]	300 Series Stainless steel	
31	Disc Springs	Inconel	

Non FIRE-TITE 1/2" – 1-1/2" (DN 15 – 40) Full Bore Series 9000 Valves

Part No.	Part Name	Body Material	
		Carbon Steel (22)	316 Stainless Steel (36)
1	Body	Carbon steel ASTM A216 Type WCB	316 Stainless steel ASTM A351 Type CF8M
2	Insert	Carbon steel ASTM A216 Type WCB	316L Stainless steel ASTM A351 Type CF3M
3	Ball	316 Stainless steel +	
4	Stem	316 Stainless steel + or 17-4 PH Stainless steel [2]	
5	Seat	PTFE, Peek #, UHMWPE, as specified	
6	Body Seal	TFM, UHMWPE (w/UHMWPE seats), Graphite (w/Peek seats)	
8	Primary Stem Seal	TFM (w/XTREME seats), PTFE (w/PTFE seats), Graphite (w/Peek seats), UHMWPE (w/UHMWPE seats)	
10	Stem Guide	Peek (Peek seated valves)	
16	Hex Nut	316 Stainless steel	
17	Handle	Carbon steel (zinc plated)	300 Series Stainless steel
19	Lockwasher	300 Series Stainless steel	
20	Compression Plate [3]	316 Stainless steel	
24	Stem Bearing	Filled PTFE (Peek when Peek seated), UHMWPE (w/UHMWPE seats)	
25	Socket Cap Screw	300 Series Stainless steel	
26	Handle Stop Spacer	300 Series Stainless steel	
29	Hex Cap Screw [3]	300 Series Stainless steel	
31	Disc Springs	Inconel	

Requires 17-4 PH stem

Note 1: When investment castings are used, chemical and physical properties are determined from a master heat in accordance with ANSI B16.34-1996 Sect. 5.1.2.

Note 2: 17-4 PH stems required with Peek seats.

Note 3: When trim is Monel or Hastelloy C, compression plate and hex cap screws are Monel.

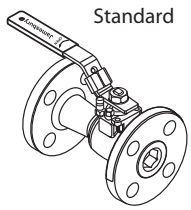
\+ Furnished with valves for NACE MR0103 service.

ACCESSORIES

Locking Devices

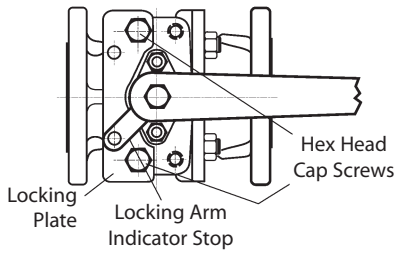
When safety measures are necessary, a reliable locking plate is available to allow the valve to be padlocked in either the open or closed position. Proper figure numbers are shown in the Accessory Table below.

Slide Lock
Standard



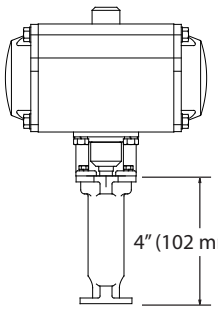
1/2" – 1-1/2" (DN 15 – 40)
Series 9000

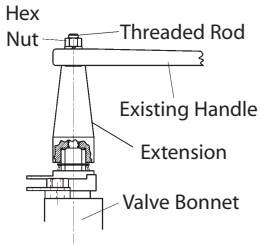
2" – 6" (DN 50 – 150) Series 9150
2" – 4" (DN 50 – 100) Series 9300
LD56, 57 & 58



Bonnet/Stem Extensions SE-084, 085 & 086

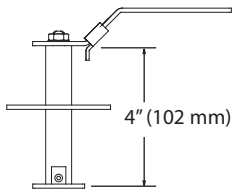
4" (102 mm) bonnet/stem extensions are available for applications that require insulated pipe, particularly useful for automated products, extensions can also be used to prevent interference between actuators and companion pipelines and equipment. They are ideal as extension that require locking lever or locking oval handle capability. Stainless steel construction offers the option of using the extension to complement the carbon steel stem extension (SE-093, 094 & 095) offering.





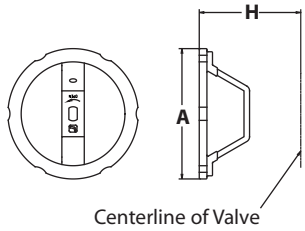
Stem Extensions SE-093, 094 & 095

A standard 4" (102 mm) stem extension is offered for Series 9000 valves (1/2 – 1-1/2" (DN15 – 40)) for improved accessibility, particularly when used in insulated pipelines. Stem extension kits can be ordered factory-mounted or shipped separately for field mounting



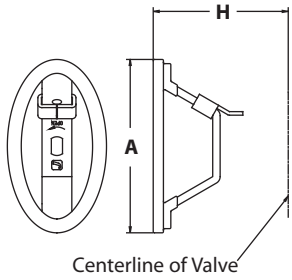
Round Handles

Series 9000 ball valves have optional round handles available. To order handles separately, specify the part number shown in the accessories table below.



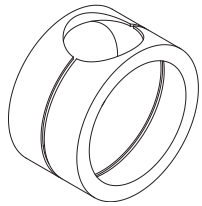
Oval handles with slide-lock

Optional oval handle saves space and may be padlocked to retain the valve in the open or closed position.



Cavity Fillers

Cavity fillers are available in 9000 series full bore valves. The fillers are PTFE and used for sanitary applications and in processes where cross contamination is a concern. Food processing, pharma-chemicals, cosmetics, paints, solvents, finishes and dyes are typical applications where fillers are employed.



Accessory Table – inches (DN)

1-1/2" (40)		SE-095	SE-098	112-0110-30	112-0107-30	5.75 (146.0)	4.94 (125.5)	25 (34)	25 (34)
2" (50)	LD56	SE-60	NA						
3" (80) 9150	LD56	SE-60							
3" (80) 9300	LD57	SE-61							
4" (100) 9150	LD57	SE-61							
4" (100) 9300	LD58	SE-62							
6" (150) 9150	LD58	SE-62							

* For valves with PEEK(L) seats that require stem extensions use bonnet/stem extension SE-096, 097 or 098.

VALVE TORQUE DATA

Use these torque charts as a guide for actuator selection. Additional requirements may be imposed by media characteristics, trim, and frequency of valve operation. For clean lubricating fluid service, required torque for PTFE (T), XTREME (X) and filled PTFE (M) seated valves only may be reduced 20% when the valve is equipped with corrosion resistant trim. For difficult services such as slurries and semi-solids, and for oxygen, increase values by 50%. If in doubt, err on the side of safety by using a larger actuator than would normally be selected.

Valves with E-PAK® require an increase in operating torque. Refer to Bulletin B115-4 for additional information.

Torque output values and actuator selection tables for the different types of JAMESBURY actuators are contained in the bulletins listed below.

Manual Gear Actuators	A100-1
B-Series Piston Actuators	6B20
QUADRA-POWR® X Spring Diaphragm Rotary Actuators	A110-4

TTT	PTFE/PTFE[2]/PTFE[2]	All
MTT	Filled PTFE/PTFE/PTFE	14 – 24" (DN 350 – 600) Full Bore
BTT	PFA/PTFE[2]/PTFE[2]	1/2 – 6" (DN 20 – 150) Full Bore
LGG †[13]	Peek/Graphite/Graphite	1/2 – 4" (DN 20 – 100) Full Bore
UUU[1]	UHMW/UHMW/UHMW	1/2 – 8" (DN 15 – 250) Full Bore
MBT[1]	Barrier-filled PTFE	3 – 10" (DN 80 – 250) Full Bore
ZTT	TFM/PTFE[2]/PTFE[2]	1/2" – 10" (DN 15 – 250) Full Bore

* Use first two letters only for Series 6000 valves
† Requires 17-4PH Stem
1 Non-FIRE-TITE only
2 TFM on sizes 1-1/2" (DN 40) and smaller
3 Not a self relieving seat design

8	Bolts	Nuts	Application
1*	ASTM A193 Gr B7	ASTM A194 Gr 2H	Carbon Steel Monel
2	ASTM A193 Gr B8, B8C, B8M or B8T (Class 2)	ASTM A194 Gr 8B, 8CB, 8MB, 8TB, or 8FB	316 St. Stl. Alloy 20
5**[4]	ASTM A193 Gr B7M	ASTM A194 Gr 2HM	NACE
4**	Monel		Monel NACE All Cl_2

Bolts and nuts for 1-1/2" (DN40) and smaller valves apply to bonnet hardware only. For 2" (DN50) and larger bolts and nuts pertain to bonnet hardware and body and cap fasteners.

* Stainless bolting standard for 1-1/2" and smaller
** Required for compliance to NACE MR0103-2003 2" and larger.
4 1-1/2" (DN 40) and smaller use Monel bonnet hardware for NACE MR0103-203 compatibility.

Hastelloy is a registered trademark of Haynes International, Inc. Monel is a registered trademark of Inco. Delrin is a registered trademark of Dupont Co.

STANDARDS AND SPECIFICATIONS

The Company

ISO 9001 – 2000 ANSI/150/ASQ Q9001 – 2000
Pressure Equipment Directive 97/23/EC

The Product - Standard

API 598	American Petroleum Institute - Valve Inspection and testing
API 607 Edition 4	American Petroleum Institute - Fire Test for Soft Seated Valves (Division of refining)
API 608	Metal Ball Valves Used in On-Off Service that have Buttwelded or Flanged Ends for Size 1/2 – 2" (DN 15 – 50) NPS
ANSI/ASME B16.10	American National Standard - Face-to-Face and End-to-End Dimensions of Ferrous Valves
ANSI/ASME B16.5	American National Standard - Steel Pipe Flanges and Flanged Fittings
ANSI/ASME B16.34	American National Standard - Steel Valves - Flanged and Buttwelded End
ANSI/ASME B31.1	American National Standard - Power Piping
ANSI/ASME B31.3	American National Standard - Chemical Plant and Petroleum Refinery Piping
ANSI/FCI 70-2-1991	American National Standard - For Control Valve Seat Leakage
BS 2080:1989	British Standards Institute - Specification for Face-to-Face Dimensions of Flanged and Buttwelded Steel Valves
BS 6755-2:1987	Testing of Valves. Specification for Fire Type-Testing Requirements
ISO 15848-1	Industrial Valves - Fugitive Emissions - Measurement, Test & Qualification Procedures
ISO 5752:1982	International Standard for Organization Metal Valves for use in Flanged Piping Systems
ISA 75.02	Valve Sizing Coefficient Cv, Piping Geometry Factor Fp and Pressure Drop Limitation XT
ISA S75.19	Hydrostatic Testing of Control Valves
ISO 5211	Dimensions for Attachment of Actuators/Gear Boxes to Valves (ISO Mounting)
MSS SP-25	Manufacturers Standardization Society - Standard Marking System for Valves
MSS-SP-55	Manufacturers Standardization Society - Quality Standards for Steel Castings
MSS-SP-6-1996	Standard Finishes for Contact Faces of Pipe Flanges and Connecting-End Flanges of Valves and Fittings
MSS-SP-44-1996	Steel Pipe Line Flanges
MSS-SP-61-1992	Pressure Testing of Steel Valves
MSS SP-72-1992	Flanged or Butt and Weld End Ball Valves Having Full or Reduced Bores for General Liquid and Gas Service
MSS SP-96-1996	Terminology for Valves and Fittings

The Product - Optional

BS 5351	Steel Ball Valves for the Petroleum, Petrochemical and Allied Industries
97 / 23 / EC	European Pressure Equipment Directive
MSS SP-53-1995 (R-1990)	Quality Standard For Steel Castings and Forgings for Valves, Flanges and Fittings and Other Piping Components-Magnetic Particle Examination Method
MSS SP-93-1987 (R-1992)	Quality Standard For Steel Castings and Forgings for Valves, Flanges and Fittings and Other Piping Components-Liquid Penetrant Method
NACE Standard MR0103	National Association of Corrosion Engineers-Engineers - Materials Resistant to Sulfide Stress Cracking in Corrosive Petroleum Refining Environments
Factory Mutual (FM)	Figure 1052 Gas and Oil Shutoff Valves.
Underwriter Laboratory (UL)	Categories MHKZ, YQAR, YRBX, YRPV, YSDT.

Current Ratings

Contact Configurations – Direct opening contacts to meet IEC 947-5-1 requirements for positive opening contacts, snap action, slow make-slow break, Reed contacts and other terms used below are described in the glossary of the Product Catalogue.

Maximum Current Ratings For Control Circuit Contacts – All Types

Switch Type	Contacts	Direct Opening Contacts to Meet IEC 947-5-1 Requirements for Positive Opening Contacts	AC – 50 or 60 Hz					DC			AC or DC

✱ Use of a transient suppressor will extend life of the switch when using on heavy electrical loads.
● SPST versions are rated $^1/_2$ HP at 110 and 200 Vac.

Alternate Current Ratings – Several product lines offer special versions or options with alternate contact configurations or contact materials, which may result in current ratings that differ from those listed above. Refer to the respective product sections for further information.

XCM														X
XCK-ML	X	X	X	X						X	X		X	

X Indicates NEMA or IEC Type Rating available for each product.
O Indicates ratings available through use of booted or other versions.
♦ The enclosure ratings for these switches are for the protection of the live electrical components. During installation and operation, precautions must be taken to prevent any ingress of contaminants, particles and corrosives, including liquids containing solids, from entering into the operating key entry area. If precautions are not taken, switches may not perform to publish specifications. Use in a salt atmosphere is not recommended.
▲ For indoor use only.
▼ Enclosure ratings are NEMA 1, 2, 3, 4, 6, 6P, 12, and 13 except for option 21 (low force) which is NEMA 1 only. The 9007 MOS5 (omni-directional operation) enclosure ratings are 1, 2, 12, and 13.

Ambient Temperature Ranges

Minimum Temperature: The minimum temperatures listed below are based on the absence of freezing moisture or water. Care should be taken to avoid sub-freezing temperatures where dripping or splashing water is present and to avoid bringing a cold switch into a warm humid atmosphere and then back into sub-freezing temperatures. The water or moisture can freeze around the switch lever arm or plunger and cause jamming.

	Low Temperature	High Temperature At Full Rated Load
AF, AW		
Lever Type	-65°F (-54°C)	185°F (85°C)
Plunger Type	0°F (-17.8°C)	185°F (85°C)
C (9007)		
Lever Type	-20°F (-28.9°C)	185°F (85°C)
Plunger & Wobble Stick Type	0°F (-17.8°C)	185°F (85°C)
FT, T ✱	-10°F (-23°C)	185°F (85°C)
L	0°F (-17.8°C)	200°F (93°C)
MS/ML (9007)	-40°F (-40°C)	221°F (105°C)
XA	-20°F (-28.9°C)	140°F (60°C)
XCK-J, L, P, T	-13°F (-25°C)	158°F (70°C)
XCM, XCK-ML	-13°F (-25°C)	158°F (70°C)

✱ The Type FT will withstand hot falling sand up to 300˚F (149˚C); **however,** ambient temperature for the FT switch is the same as the Type T above and **cannot be used in higher temperature ambients.**

Alternate Temperature Limits

Some switches are available with higher or lower temperature limits, by selecting special versions or special options. Refer to the respective product sections for further information.

Sealing

AF, AW
- Plunger seals . . . . . PTFE (Teflon)
- All other seals . . . . . nitrile (Buna N)

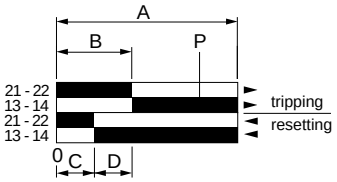
C, CF, CR (9007)
- Standard shaft seals on lever types . . . . . fluorocarbon (VITON)[1]
- Plunger and wobble stick boots . . . . . neoprene
- All other seals . . . . . nitrile (Buna N)
- Fluorocarbon seals are available in place of nitrile and neoprene on 9007 Type C.

L . . . . . PVC

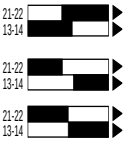
T and FT
- Shaft seal . . . . . nitrile (Buna N)
- Cover gasket . . . . . nitrile (Buna N)
- Base plate gasket . . . . . cellulose fiber laminate

XCK-J, P, T . . . . . nitrile

Contact Function Diagrams



A=Maximum travel of the operator in mm or degrees.
B=Tripping travel of the contact.
C=Resetting travel of contact.
D=B-C=Differential travel.
P=Point from which positive opening is assured.



Make-before-break (overlapping) SPDT: the normally open contact closes before the normally closed contact opens.

Break-before-make (offset) SPDT: the normally closed contact opens before the normally open contact closes.

Simultaneous make and break - SPDT: the normally closed contact opens at the same time as the normally open contact closes.

Terms used in identifying ratings are defined in the glossary of the Product Catalogue.

Metal, Fixed or Plug-in Body
General Characteristics

Environment

Conforming to standards	Products	IEC 947-5-1, IEC 337-1, EN 60 947-5-1, NF C 63-146, VDE 0660-200, UL 508, CSA C22-2 n° 14
	Machine assemblies	IEC 204-1, EN 60 204-1, NF C 79-130
Approvals		CSA A300, UL A300 Listed, NEMKO FI 10 (4) A-400 V, GL, BV, USSR A300=fixed, A600=plug-in
Protective treatment		Standard version : "TC". Special version : "TH"
Ambient air temperature		Operation : - 25…+ 70 °C. Storage : - 40…+ 70 °C Special sub-assemblies available for extreme operating temperatures (- 40°C or + 120 °C)
Vibration resistance		25 gn (10…500 Hz) conforming to IEC 68-2-6
Shock resistance		50 gn (11 ms) conforming to IEC 68-2-27
Electric shock resistance		Class I conforming to IEC 536 and NF C 20-030
Degree of protection		**IP 66 conforming to IEC 529 ; IP 667 conforming to NF C 20-010**
Repeat accuracy		0.01 mm on the tripping points
Cable entry		1/2" NPT

Contact block characteristics

Rated operational characteristics	**~ AC-15 ; A300 (Ue = 240 V, Ie = 3 A)** **⎓ DC-13 ; Q300 (Ue = 250 V, Ie = 0.27 A) conforming to IEC 947-5-1 Appendix A, EN 60 947-5-1**
Rated insulation voltage	Ui = 500 V degree of pollution 3 conforming to IEC 947-1 and VDE 0110, group C conforming to NF C 20-040 Ui = 300 V conforming to UL 508, CSA C22-2 n° 14
Rated impulse withstand voltage	U imp = 6 kV conforming to IEC 947-1, IEC 664
Positive operation (varies by model)	N/C contacts with positive opening operation conforming to IEC 947-5-1 Section 3, EN 60 947-5-1
Resistance across terminals	≤ 25 mΩ conforming to NF C 93-050 method A or IEC 255-7 category 3
Short-circuit protection	10 A cartridge fuse type gG (gl)
Cabling	Screw and captive cable clamp terminals. **XESP2151** and **XESP2141** : Clamping capacity, min. : 1 x 0.34 mm², max. : 2 x 1.5 mm² **XENP21●1** : Clamping capacity, min. : 1 x 0.5 mm², max. : 2 x 2.5 mm² **XCKJ plug-in and XESP20●1:** Clamping capacity, min. : 1 x 0.75 mm², max. : 2 x 1.5 mm²
Minimum actuation speed	**XESP2151, XCKJ plug-in, XESP20●1** : 0.001 m/minute, **XENP21●1** : 0.001 m/second

Electrical durability

Conforming to IEC 947-5-1 Appendix C.
Utilisation categories AC-15 and DC-13.
Maximum operating rate : 3600 operating cycles per hour.
Load factor : 0.5

Moduflow™ Series

IL2/RF2/CF2 Low Pressure Filters

Applications for Moduflow Filters

- Power Unit Fabrication
- Off-line Filter Loops
- Mobile Equipment

The Moduflow filter is widely considered the most versatile filter available on the market. The unique diverter valve assembly, and inside to outside flow through the element, allows the Moduflow to be configured for in-line, in-tank or suction filtration. The flow diverter minimizes turbulence and pressure loss through the filter, improving system performance.

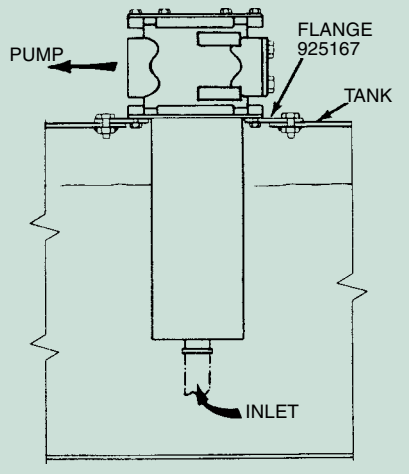
The newly designed closed bottom elements for the RF2 and IL2 models insures all contamination remains trapped within the element as the filter is serviced.

A wide variety of visual and electrical indicators allows you to know exactly when the element needs to be serviced. There is even a "no element" indicator that can sense when there is not an element installed in the filter.

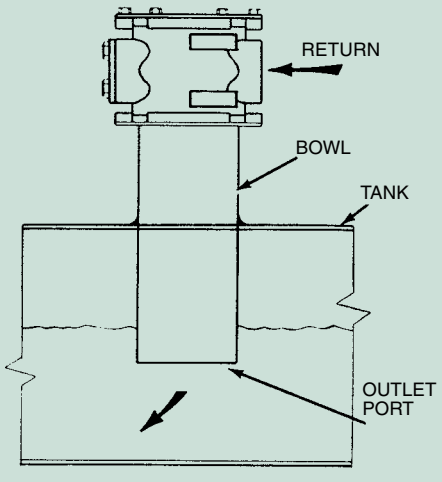
From top to bottom, the Moduflow filter series provides the high level of filtration and long term dependability so vital to today's hydraulic systems.

Mounting / Porting Styles

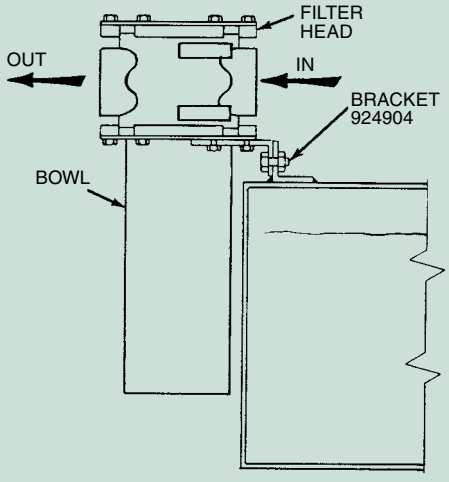
CF2 Suction Filter



RF2 Return Filter



IL2 In-Line Filter



Features

Flanges
- NPT or SAE ¾" to 2"
- Lightweight aluminum

Cover
- Slotted for quick release
- Lightweight aluminum

Indicators
- Visual or electrical
- Mounted on either side
- Optional "no element" indication

Bowl
- Single or double length
- Durable steel construction

Bypass/Diverter
(not visible)
- 5 different pressure settings
- No bypass option available

Element
(not visible)
- Available in cellulose, wire mesh or high performance Microglass II media
- Single or double length

Feature	Advantage	Benefit
• Top access element service	• Oil remains in housing • Quicker element change	• No spills • Reduced maintenance costs
• Slotted cover	• Quick release cover • Cap screws remain in housing	• Reduced maintenance costs • No loose parts to lose
• Closed bottom elements (RF2 and IL2 only)	• Removes all contaminant during element service	• No downstream contamination from servicing
• Visual or electrical indicators	• Know exactly when to service elements	• Helps prevent bypass condition • No premature disposal
• Flange face ports	• Flexible mounting (3/4" to 2")	• Easy plumbing to your system

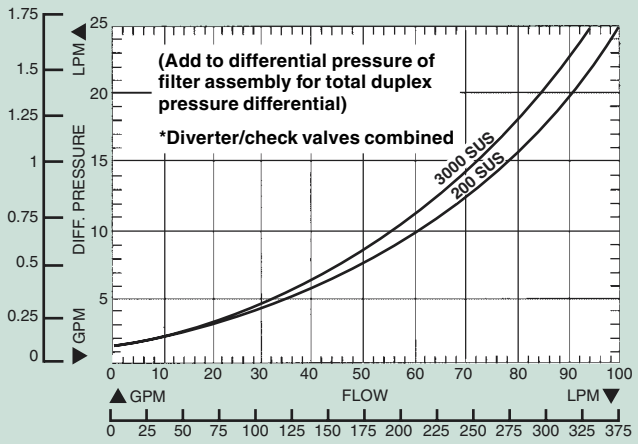
Typical Flow/Pressure Curves For Duplex Valves



Submersible Option

When there is a limited amount of space on the top of the reservoir, the Moduflow filter can be mounted in the side of a reservoir.

A check valve mounted on the filter bowl prevents the reservoir from being drained during servicing of the element. The only fluid drained is from the inside of the filter housing.

For return line applications(RF2), the fluid returning to the reservoir holds the check valve open. When the system is shut down, the check valve closes automatically. In suction applications (CF2), the check valve is held open by a check rod assembly extending from the cover to the check valve at the base of the filter bowl. When the cover is in place, fluid enters the filter. When the cover is removed for servicing, the check valve closes.

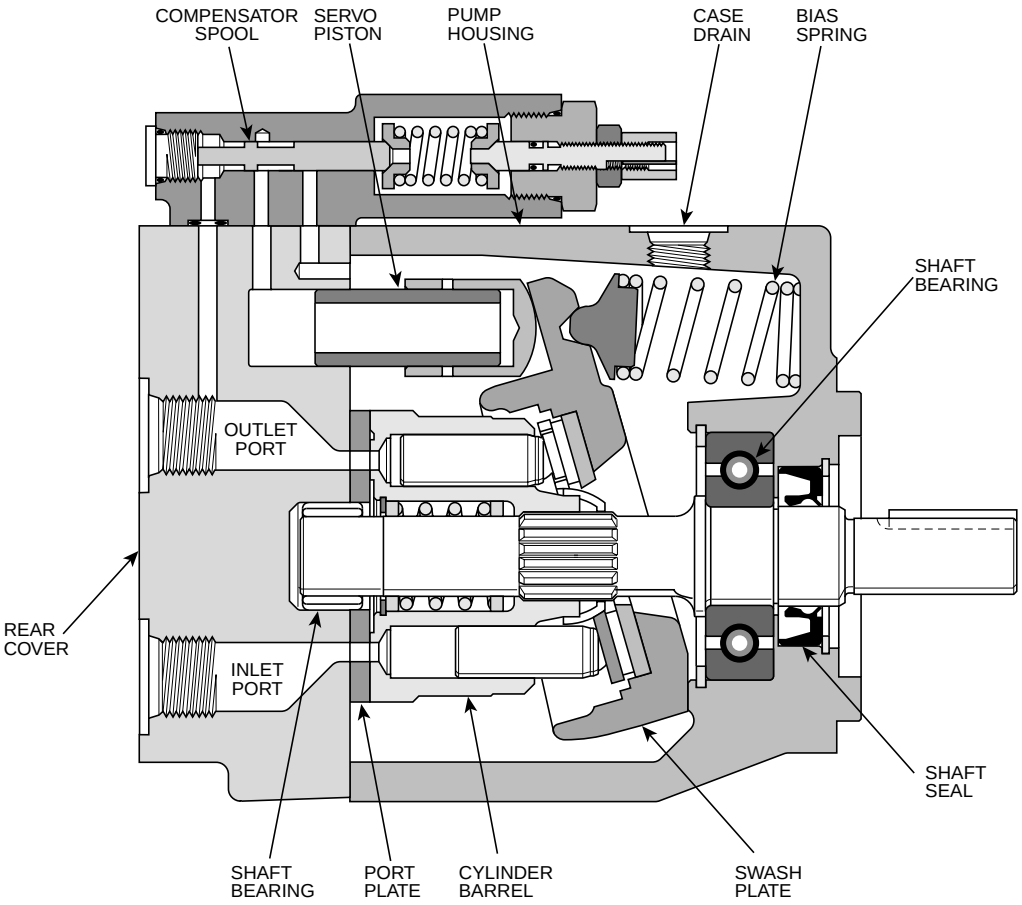
* Since many variables such as mounting, tank style, plant layout, etc., effect noise levels, it cannot be assumed that the above readings will be equal to those in the field. The above values are for guidance in selecting the proper pump. Noise levels are A-weighted, mean sound pressure levels at 1 meter from the pump, measured and recorded in accordance with applicable ISO and NFPA standards.



Features

- High Strength Cast-Iron Housing
- Fast Response Times
- Two Piece Housing For Ease of Service
- Metric Pilot, Shaft and Ports Available
- Replaceable Bronze Clad Port Plate
- Thru-Shaft Capability
- Low Noise Levels
- Replaceable Piston Slipper Plate

Controls

- Pressure Compensation
- Load Sensing
- Horsepower Limiting
- Horsepower and Load Sensing
- Remote Pressure Compensation
- Adjustable Maximum Volume Stop
- Hi/Lo Torque (Horsepower) Limiting (PVP 41/48, 60/76 Only)
- Low Pressure Standby

Control Options

General Description

All control is achieved by the proper positioning of the swash plate. This is achieved by a servo piston acting on one end of the swash plate working against the combined effect of the off-setting forces of the pistons and centering spring on the other end. The control spool acts as a metering valve which varies the pressure behind the servo piston.

As shown in Figure 1, the amount of flow produced by the Parker Piston Pump is dependent upon the length of stroke of the pumping pistons. This length of stroke, in turn, is determined by the position of the swash plate. Maximum flow is achieved at an angle of 15-17 degrees. The rotating barrel, driven by the prime mover, moves the pistons in a circular path and the piston slippers are supported hydrostatically against the face of the swash plate. When the swash plate is in a vertical position, perpendicular to the centerline of the piston barrel, there is no piston stroke and consequently no fluid displacement. When the swash plate is positioned at an angle, the pistons are forced in and out of the barrel and fluid displacement takes place. The greater the angle of the swash plate, the greater the piston stroke.

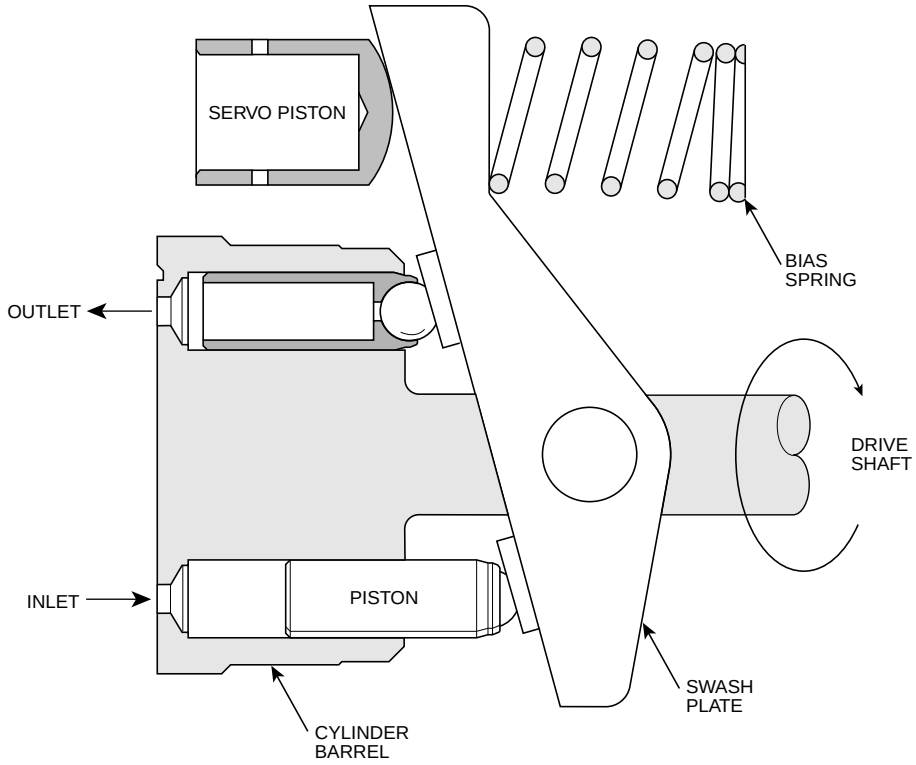


FIGURE 1

Control Options

Pressure Compensated Control

The swash plate angle controls the output flow of the pump. Swash plate angle is generated by the hydraulic force of the pumping pistons and the mechanical force of the swash plate bias spring.

Control of the pump's outlet flow is obtained by overriding the force of the pumping pistons and bias spring with the hydraulic force of the servo piston by means of internal porting. Pressure is connected from the outlet port to the servo piston via a compensator spool.

The compensator spool is held against the spring guide by the outlet pressure. When the outlet pressure reaches the setting of the compensator control, the compensator spool moves, allowing outlet pressure oil to be metered into the servo piston. This metered oil provides adequate force to power the servo piston and override and swash plate forces. The outlet pressure causes the servo piston to move which reduces the angle of the swash plate and thereby reduces the pump's output flow. When flow is again demanded by the system, the outlet pressure will momentarily fall allowing the compensator spool to move. This movement closes off the outlet pressure to the servo piston and vents the servo piston to case. The result of this venting allows the swash plate forces to move the swash plate angle to maximum displacement, thus responding to the demand for additional flow. Note that the compensator spring chamber is vented to the pump case via a hole internal to the compensator spool.

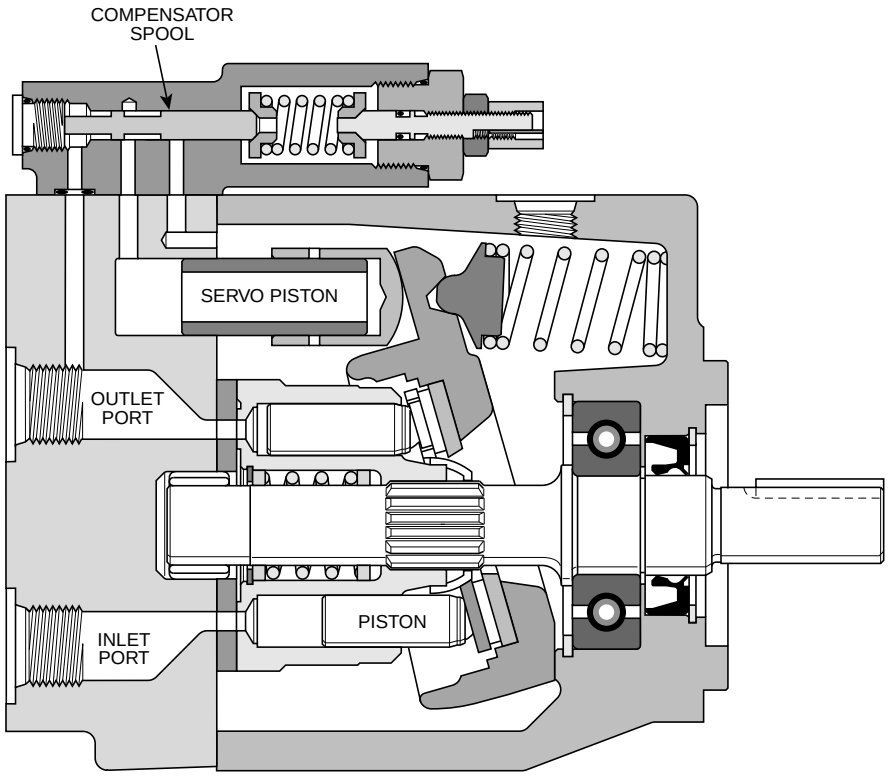

FIGURE 2

Remote Pressure Control (M)

The pump swash plate actuation is identical to the standard pressure compensator but can be controlled via a remote pressure control.

Remote control of the pump output pressure can be achieved by controlling the pressure at port A, Figure 3 on the compensator. Flow is metered through the orifice in the spool from outlet pressure into the spring chamber. The spring chamber pressure is limited by an external relief connected to port A. The controlled pressure at port A is sensed at the differential spring chamber. The compensator spool will move to the right when the pump outlet pressure reaches a force equal to the differential spring setting plus the controlled port pressure setting. When the spool moves to the right, outlet pressure oil is metered to the servo piston and the pump swash plate angle is controlled accordingly. With this option the pump outlet pressure can be controlled and varied from a remote location.

This control also incorporates a pressure limiting feature preset at the factory. When the pressure in the differential spring chamber reaches the maximum relief setting, the dart unseats allowing the spring chamber to vent to the pump case and limits the maximum pressure attainable.

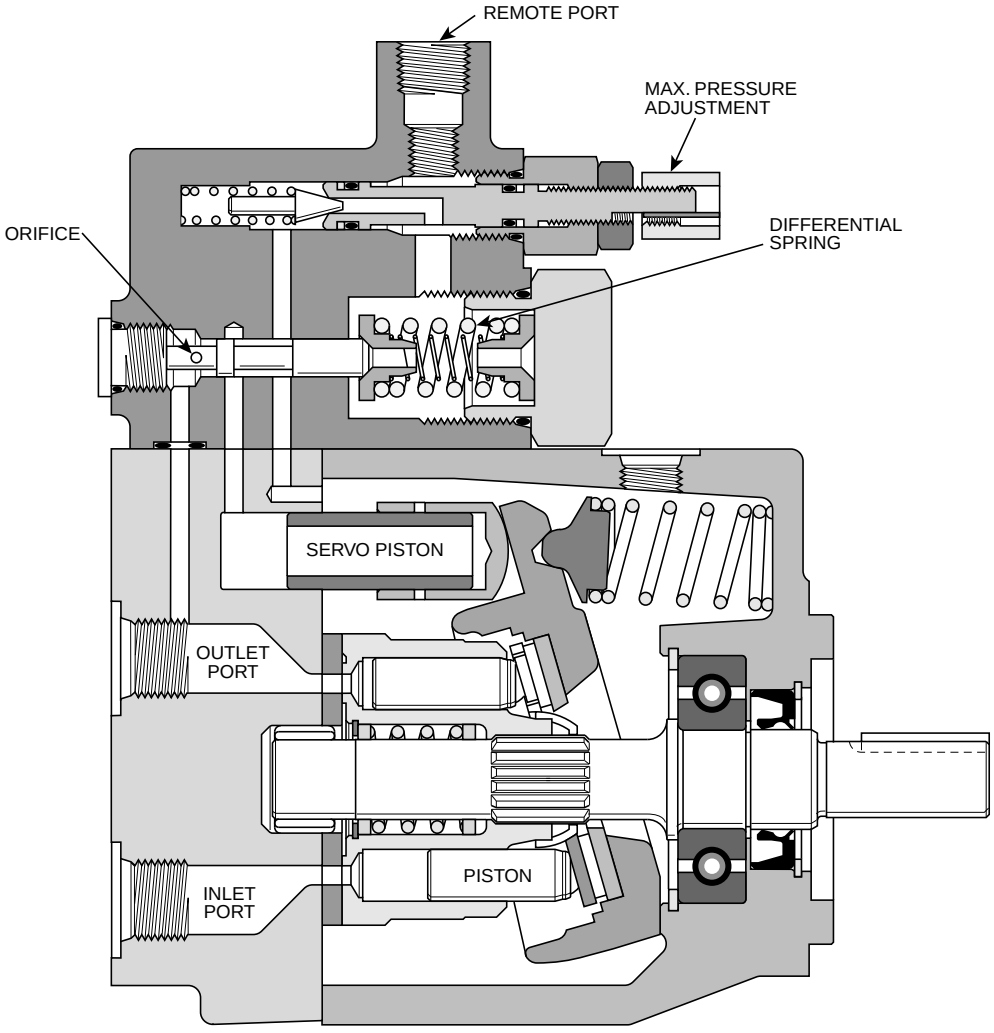

FIGURE 3

Control Options

Flow Control (Load Sensing) (A)

Figure 4 shows a PVP pump with flow control. The control is identical to the remote pressure compensation control except for an integral orifice, a solid compensator spool and adjustable differential pressure control. Port A is connected downstream of an orifice (variable or fixed) to sense the actual working pressure required. This pressure plus the differential spring force act on the right side of the compensator spool and will urge the spool to the left until output pressure acting on the left side of the spool balances the forces. As the load increases, output pressure will increase and maintain a constant differential pressure across the orifice and thus a constant flow. Maximum pressure is limited by the internal dart setting. This setting is adjustable up to the maximum preset at the factory.

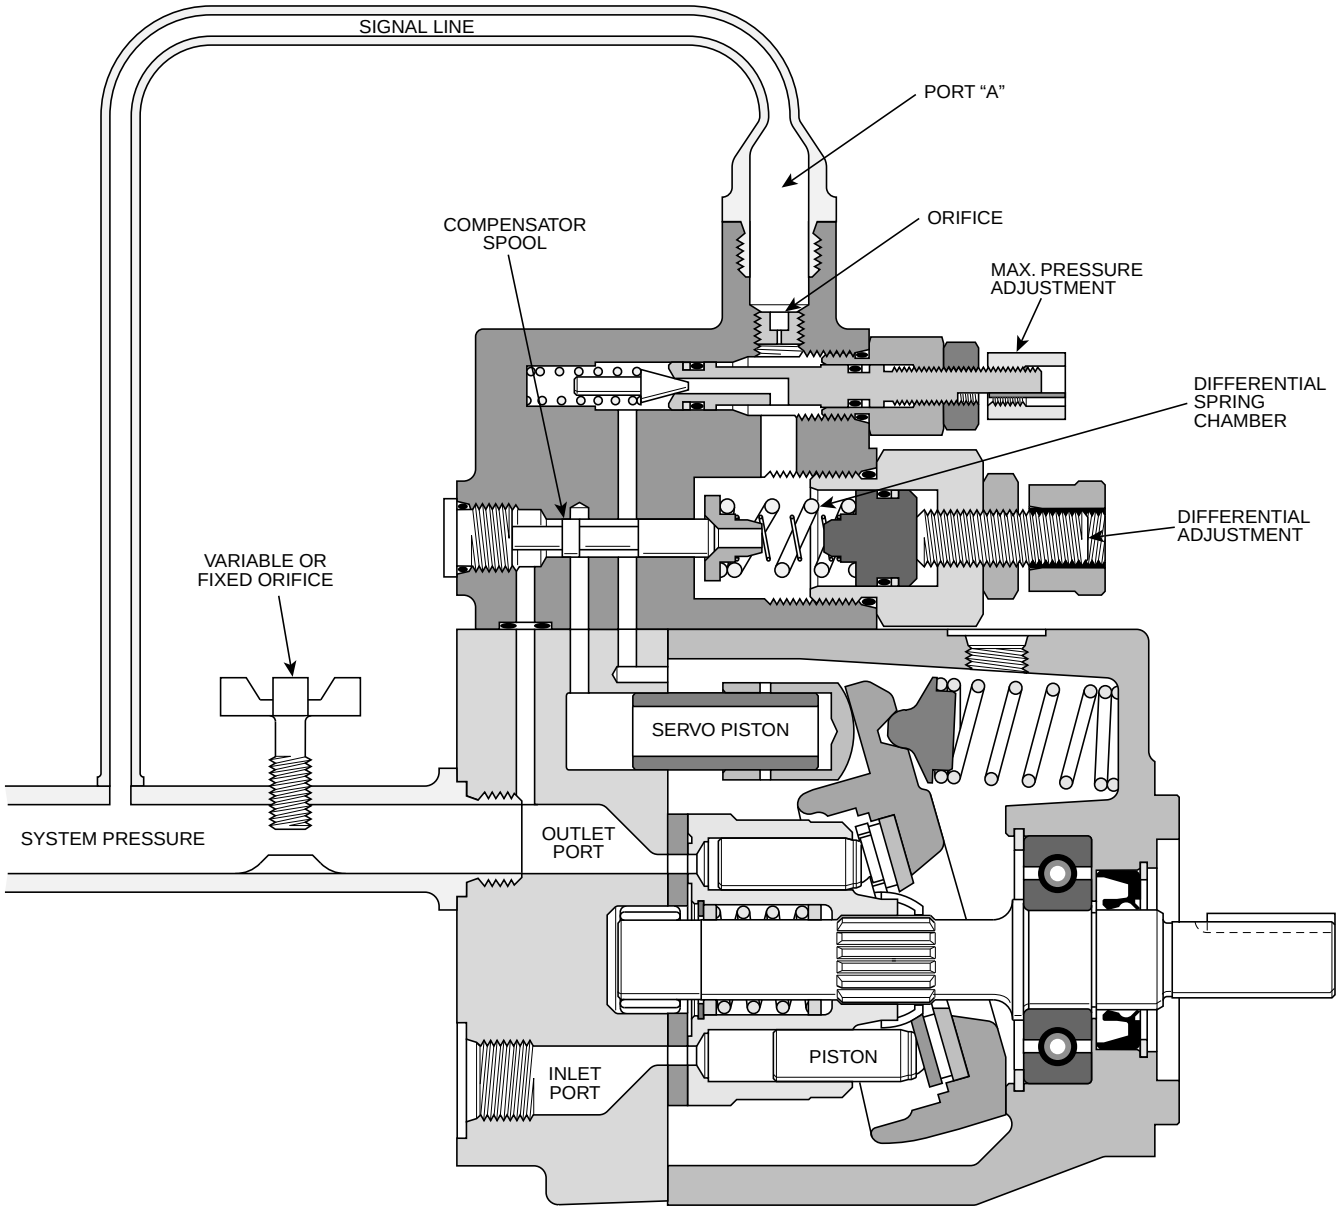

FIGURE 4

Pressure & Horsepower Control (H)

This control option is a Torque Limiting Control, but for constant speed applications it is generally referred to as a Horsepower Control. This control works in conjunction with the Remote Pressure Compensator, control option “M”. A second pressure control device called a horsepower control block, is assembled to the main pump housing. The HP block is plumbed to one of the ports on the remote compensator via steel tubing. The control dart in the HP block and the maximum pressure compensator dart in the remote compensator are connected in parallel. What makes the control dart in the HP block different from any other external relief valve is the pressure setting is mechanically linked to the pump swashplate angle.

The cracking pressure of the HP dart is generally lower than the cracking pressure of the remote compensator dart. When the HP dart opens the pressure in the differential spring cavity is lowered allowing the compensator spool to meter system pressure in the servo piston. As the servo piston extends, it rotates the swashplate and in turn rotates the HP cam. As the cam rotates it increases the force on the HP dart control spring. As the system pressure is allowed to increase, the pump gradually reduces its stroke (flow). When the system pressure reaches the setting of the maximum pressure dart the normal action of the remote compensator takes over. If the HP control is set low enough, the pump may reach zero stroke before the system pressure ever gets a chance to open the maximum compensator dart. This should be considered when making low power settings on systems requiring high working pressures.

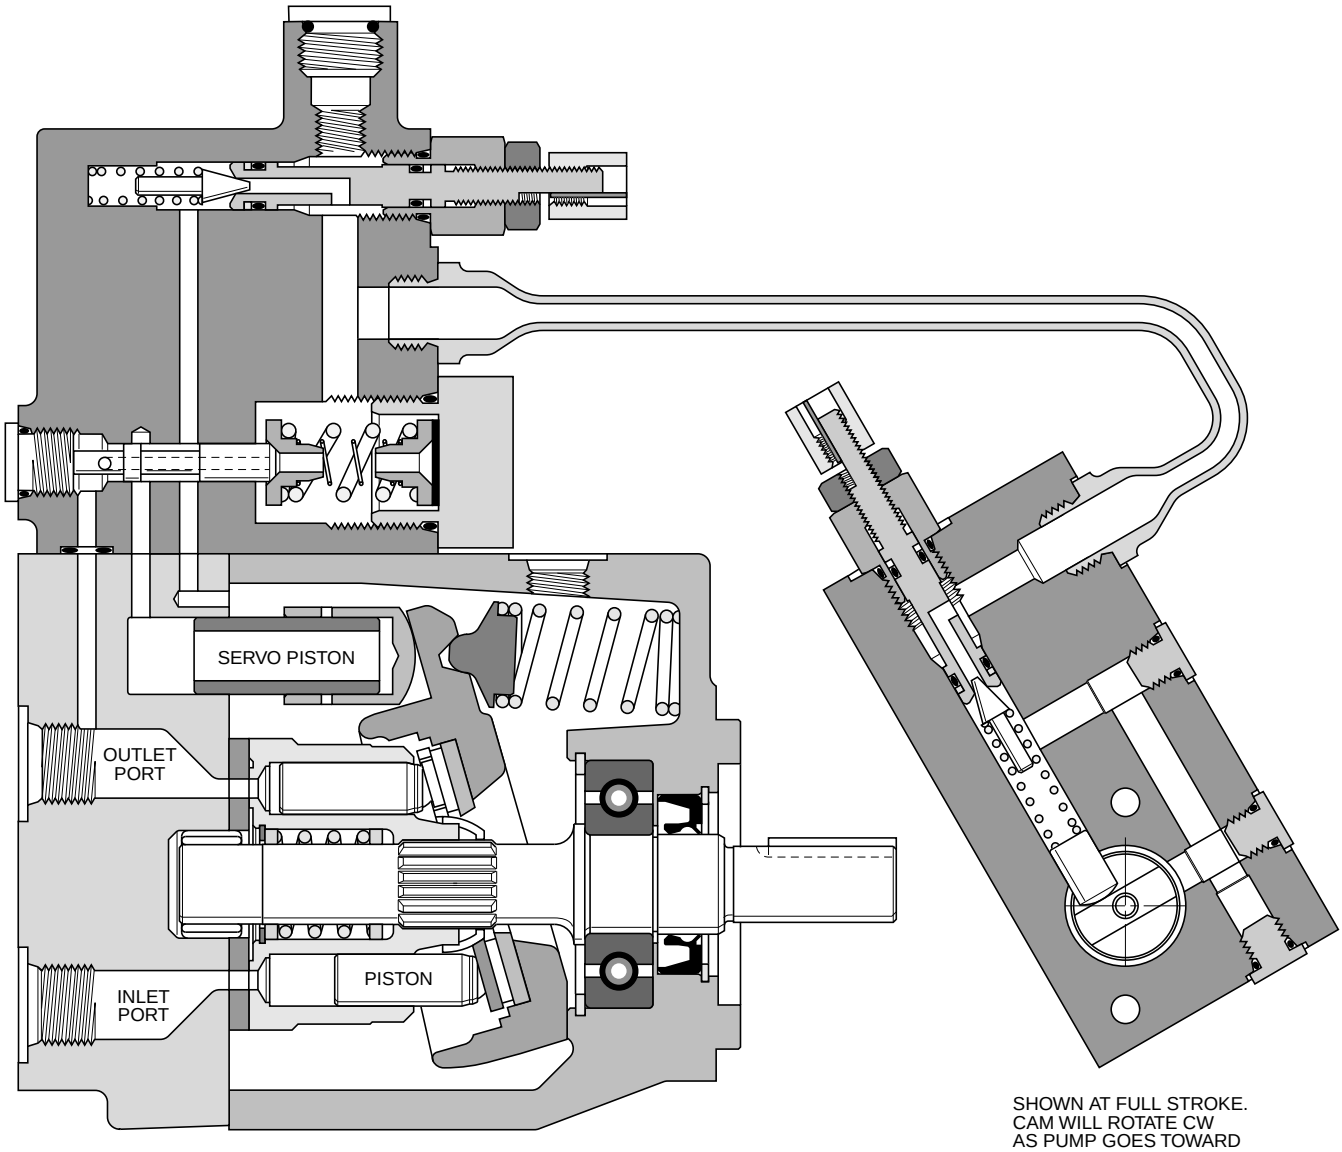

FIGURE 5

Pressure, Horsepower & Flow Control (C)

Refer to the previous section(s) on Flow Control and Power Control. This is another case where multiple controls can be combined in parallel. Since the Power Control is just a special version of Remote Pressure Control, it can be combined with the Flow Control (Load Sense) option. The main point to remember here is that the pressure drop which is required to begin and maintain compensation comes from an external device (such as a proportional valve). This sensed pressure drop will control flow until one of the limits of the other controls has been exceeded. The pump will always respond to the lowest control setting for any given pressure. In addition to Load Sensing, Power Control, and on-pump Pressure Control, Remote Pressure Control can also be included in this parallel device package. There is a remote port on the compensator body and one on the HP Control body, either of which may be used for remote pressure control. The important concept to remember in load sense circuits is that each pressure control device in and connected to the compensator must be protected from saturation. For this reason, use only the uppermost port on the compensator for connection of the load sense line and insure that an appropriate orifice is installed. All control options using a load sense compensator spool are supplied with this orifice.

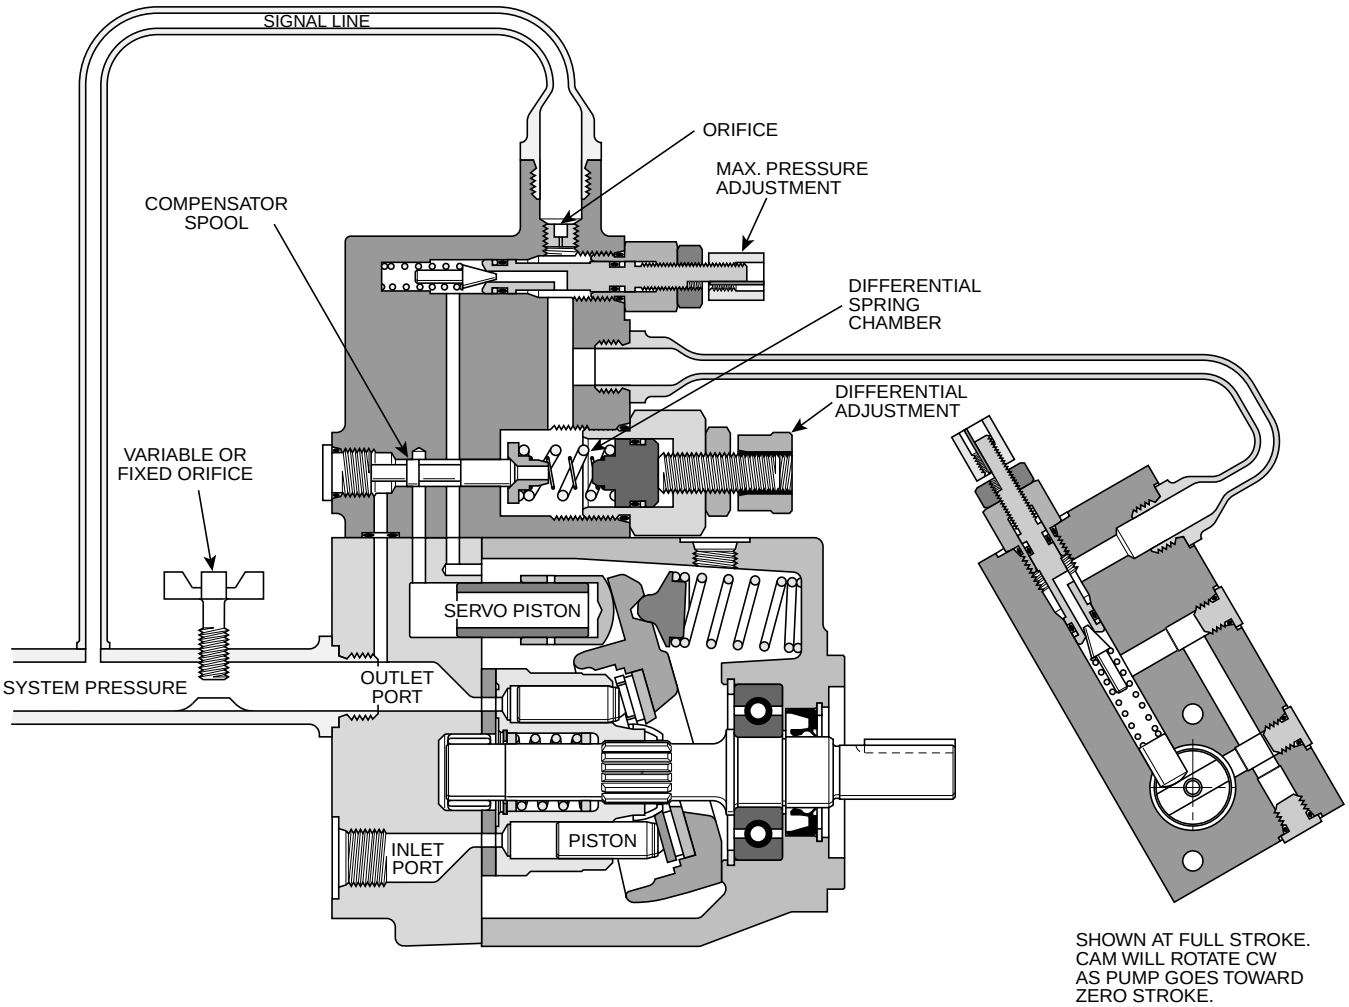

FIGURE 6

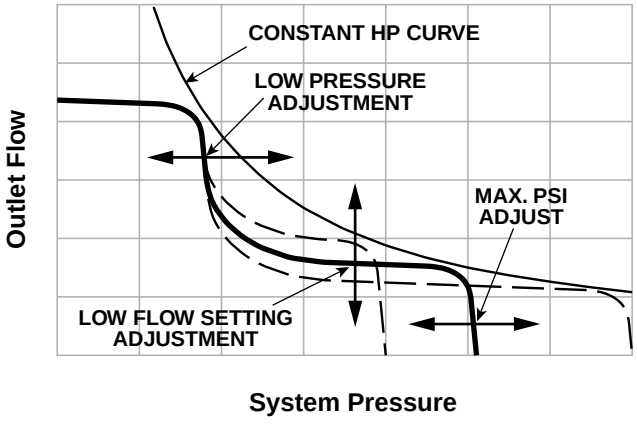
Hi/Lo Horsepower Control (HLM) available with PVP41 through PVP76 only

The graph shown below represents the flow-pressure characteristics of a Hi-Lo control for PVP pumps. There are up to four separate adjustments that must be made with the pump controls to get a particular setting, all of which influence the shape of the curve. To get the proper settings, it is very important that all pertinent information is supplied with each Hi-Lo pump ordered. As you can see from the graph below, there are two peak HP points. Our intention is to have the same magnitude of HP required for both peaks. Of course many combination of settings are possible but specification of the settings becomes very difficult. To make factory settings, we need to know the required **flow** (applicable if pump has a maximum volume stop), the **shaft speed**, the required **HP limit**, and the **compensation pressure**. Based on these requirements, we will adjust the low pressure set point and the reduced flow set point of the Hi-Lo control to best match the requested parameters called out on the order.

Important note: As with HP controls, not all combinations of flow, HP, pressure, etc. are possible. The first rule is that the settings must conceptually be achievable (i.e. HP out is ALWAYS less than HP in). Be careful in assuming efficiencies when estimating the Out/In relationship, since a pump operating at low pressure or in a de-stroked condition can have a much lower overall efficiency than expected. The other thing to keep in mind is that the pump will require the peak HP at only two points. All other operating pressures will require less than maximum HP and therefore the pump will deliver less hydraulic HP in the appropriate ratio based on the actual pump efficiency at those conditions.

Typical Hi-Lo Control Flow/Pressure Characteristics



Performance Information

Series PVP 23/33 Pressure Compensated, Variable Volume, Piston Pumps

Features

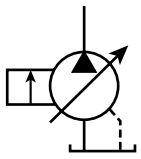
- **High Strength Cast-Iron Housing** for Reliability and Quiet Operation
- **Vickers Porting Interchange**
- **Optional Inlet/Outlet Locations** for Ease of Installation
- **Replaceable Bronze Port Plate**
- **Replaceable Piston Slipper Plate**
- **Thru-Shaft Capability** SAE A, AA and B Pilots Offered
- **Low Noise Levels**
- **Fast Response Times**
- **Metric Pilot Shaft and Ports Available**

Controls

- Pressure Compensation
- Remote Pressure Compensation
- Load Sensing
- Torque (Horsepower) Limiting
- Adjustable Maximum Volume Stop
- Low Pressure Standby

Schematic Symbol

(Basic Pump)



Specifications

Pressure Ratings

Outlet Port: 3600 PSI (248 bar) Continuous (P1)
4500 PSI (310 bar) Peak (P3)

Inlet Port: 25 PSI (1.72 bar) Maximum
5 In. Hg. Minimum @ 1800 RPM
(See inlet chart for other speeds)

Speed Ratings: 600-3000 RPM

Operating Temperature Range: – 40°F to 160°F
(– 40°C to 71°C)

Housing Material: Cast-Iron

Filtration: Maintain SAE Class 4,
ISO 16/13,
ISO 18/15 Maximum

Mounting: SAE "B" 2-Bolt Flange Mount

Installation Data: See page 54 of this catalog for specific recommendations pertaining to system cleanliness, fluids, start-up, inlet conditions, shaft alignment, drain line restrictions and other important factors relative to the proper installation and use of these pumps.

Quick Reference Data Chart

Pump Model	Displacement cc/rev (In³/rev)	Pump Delivery @ 300 PSI (21 bar) in GPM (LPM)		*Approx. Noise Levels dB(A) @ Full Flow 1800 RPM (1200 RPM)					Horsepower At 1800 RPM, Max. Displacement & 3600 PSI

PVP23	23 (1.4)	7.4 (28.0)	11.1 (42.0)	74 (69)	75 (70)	77 (75)	80 (75)	68 (63)	20.5
PVP33	33 (2.0)	10.4 (39.4)	15.6 (59.0)	4 (69)	75 (70)	77 (75)	80 (75)	69 (65)	28.5

* Since many variables such as mounting, tank style, plant layout, etc., effect noise levels, it cannot be assumed that the above readings will be equal to those in the field. The above values are for guidance in selecting the proper pump. Noise levels are A-weighted, mean sound pressure levels at 1 meter from the pump, measured and recorded in accordance with applicable ISO and NFPA standards.

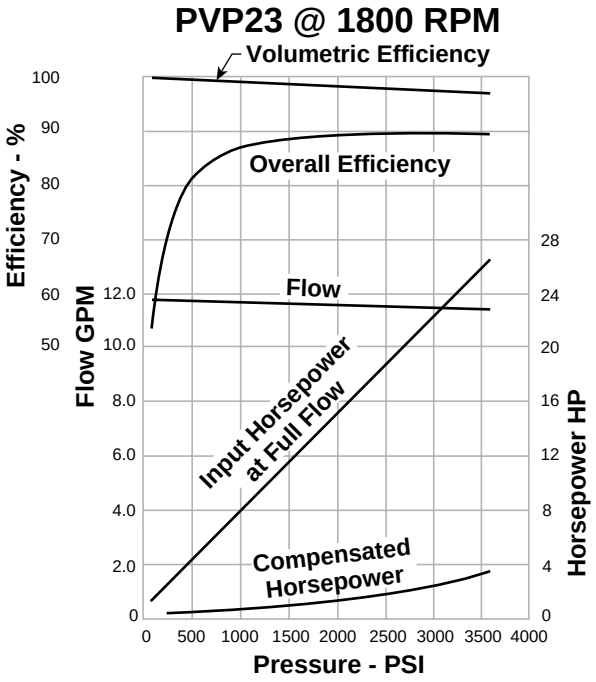
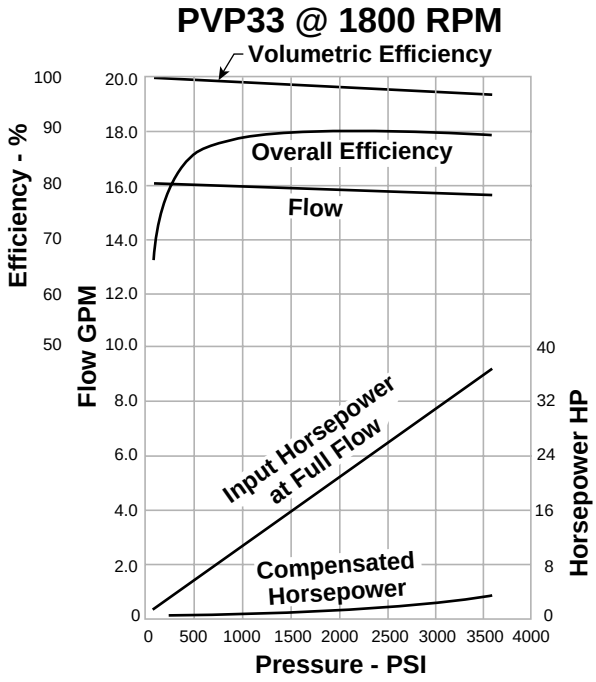
Typical Performance Data - Fluid: Standard Hydraulic Oil 100 SSU @ 120°F (49°C)





NOTE: The efficiencies and data in the graph are good only for pumps running at 1800 RPM and stroked to maximum. To calculate approximate horsepower for the other conditions, use the following formula:

$$HP = \left[\frac{Q \times (PSI)}{1714}\right] + (CHp)$$

Actual GPM is directly proportional to drive speed and maximum volume setting. Flow loss, however, is a function of pressure only.

WHERE:
Q = Actual Output Flow in GPM
PSI = Pressure At Pump Outlet
CHp = Input Horsepower @ Full Compensation @ 1800 RPM (from graph read at operating pressure)

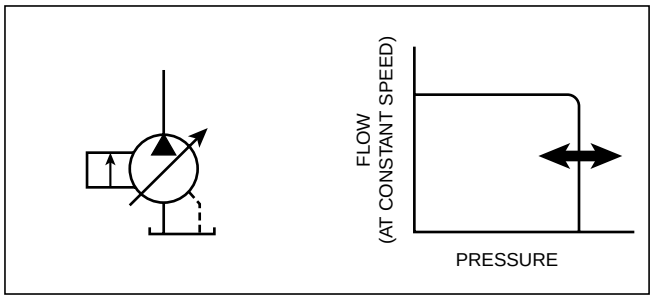
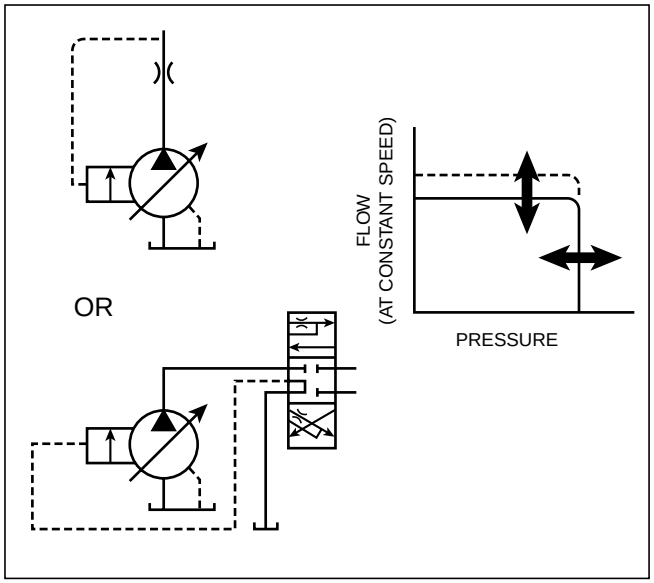
Summary of Control Circuits

All options shown are not available on all pumps.

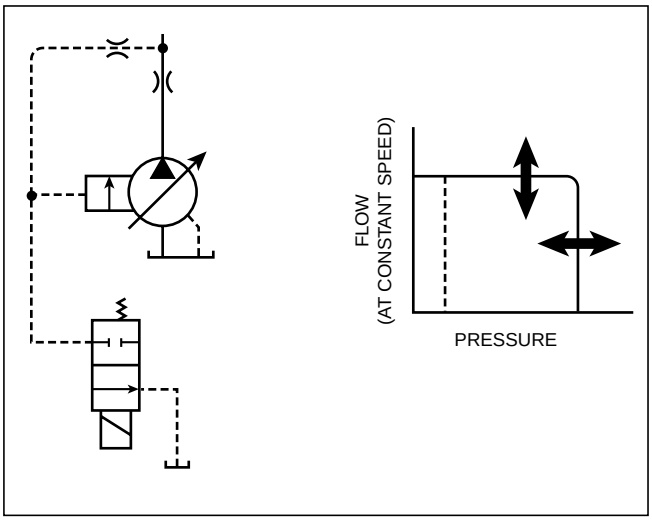
Pressure Control Option
Code: Omit



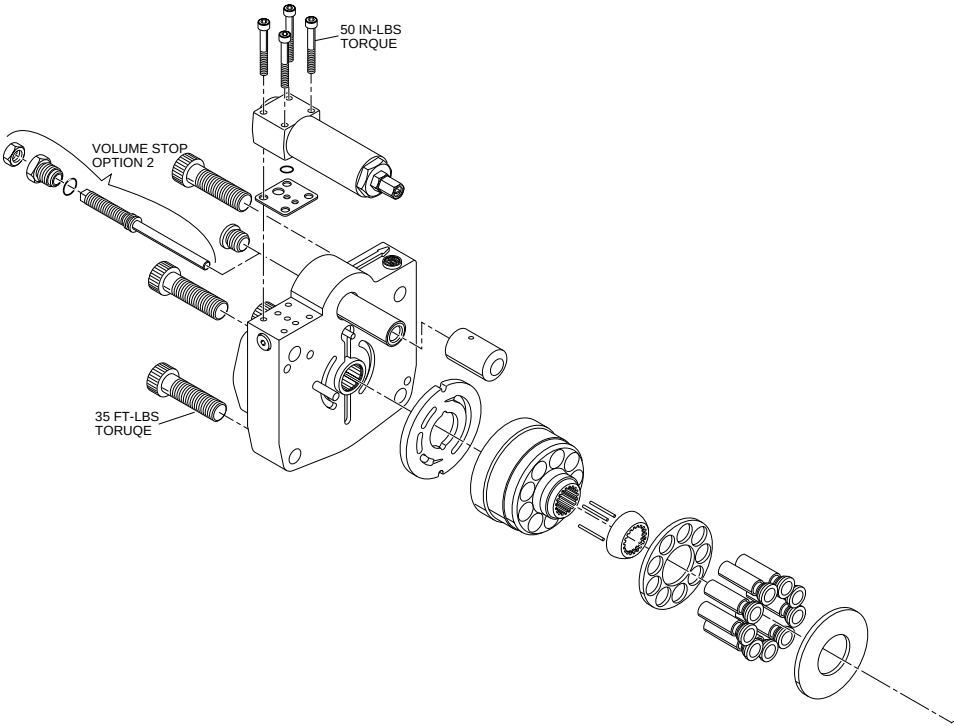
Load Sensing (Flow Control) Option
Code: A

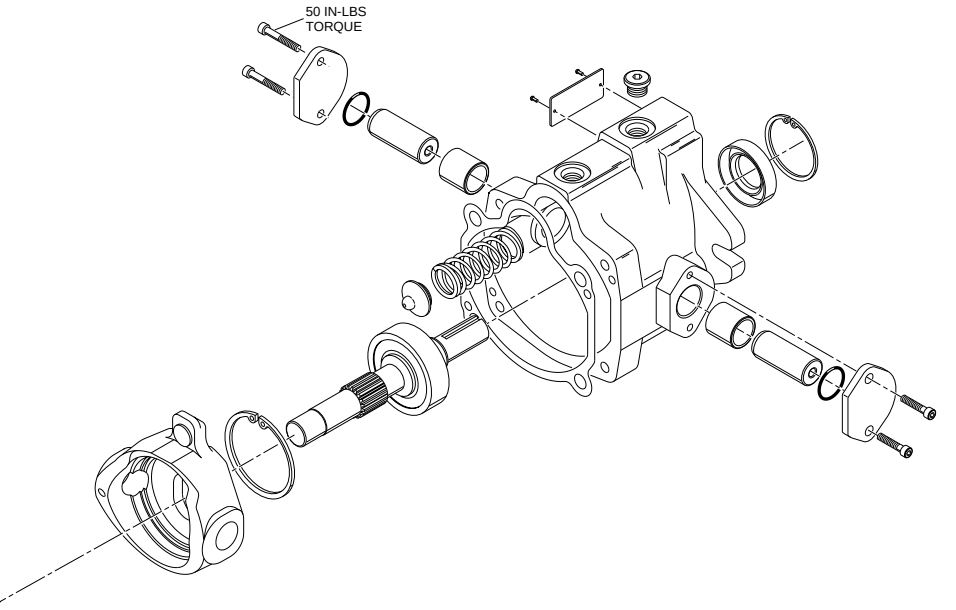


Low Pressure Standby Option
Code: A



Standard Pump Assembly





50 IN-LBS
TORQUE

Use of a Relief Valve

The use of a relief valve, while not mandatory is recommended in the main circuit to suppress hydraulic shock loads and adds additional system protection.

Fluid Recommendations

Premium quality hydraulic oil with a viscosity range between 150-250 SSU (30-50 cst.) at 100°F (38°C). Normal operating viscosity range between 80-1000 SSU (17-180 cst.). Maximum start-up viscosity is 4000 SSU (1000 cst.).

NOTE: Consult Parker when exceeding 160°F (71°C) Inlet Fluid Temperatures. Oil should have maximum anti-wear properties, rust and oxidation treatment.

Filtration

For maximum pump and system component life, the system should be protected from contamination at a level not to exceed 125 particles greater than 10 microns per milliliter of fluid. (SAE Class 4/ISO 16/13.) Due to the nature of variable displacement pumps, variations in pump inlet conditions, fluid acceleration losses, system aeration, and duty cycle we do not recommend suction line filters. We do recommend the use of a properly sized, in-tank, suction strainer. Contact your Parker representative for assistance.

Start-Up

On initial start-up, the case should be filled with oil, pressure adjustments should be reduced and the circuit should be open to permit priming.

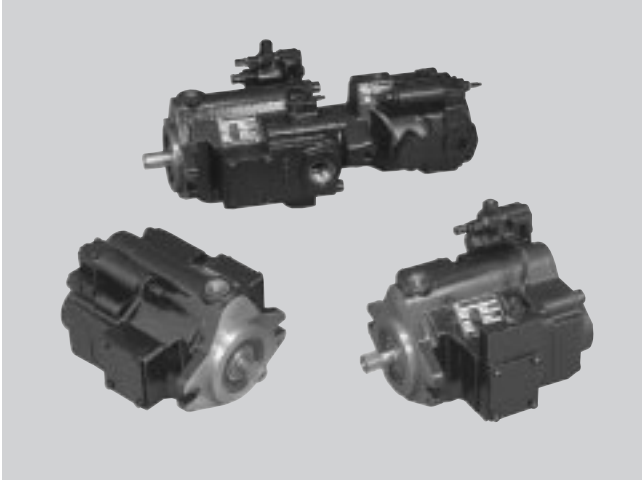
Inlet Conditions

Not to exceed 5 inched Hg. Vacuum at 1800 RPM on petroleum base fluids. See recommended speed spectrum for specific inlet conditions.

Shaft Rotation and Line Up

Pump and motor shaft alignment must be within .010 TIR maximum, using a standard floating coupling. Please follow coupling manufacturer's recommended installation instructions to prevent end thrust on pump shaft. Turn pump to assure freedom of rotation. Pump and motor must be on a rigid base.

The coupling should be sized to absorb the peak horsepower developed.



Installation and Mounting

When mounting a PVP Series Pump, the "case drain" must be on top of the pump. The "case drain" should be a separate line unrestricted to the reservoir and extend below the oil level as far from the inlet line as possible. The "case drain" line must not exceed **10 PSI (.7 bar)** back pressure. Suggested maximum line length is 10 feet.

Special Installations

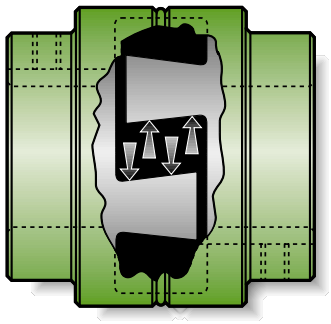
Consult your Parker representative for any application requiring the following:

Pressure above rated, drive speed above maximum, indirect drive, fluid other than petroleum oil, oil temperature above 160°F (71°C).

Inlet Pressure

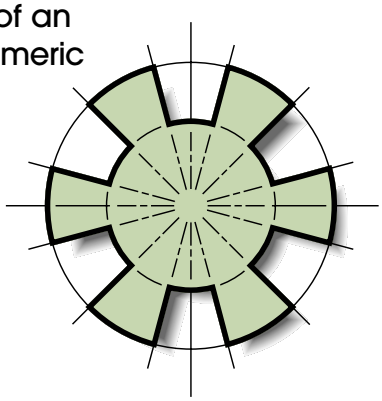
Not to exceed 25 PSI (1.72 bar).

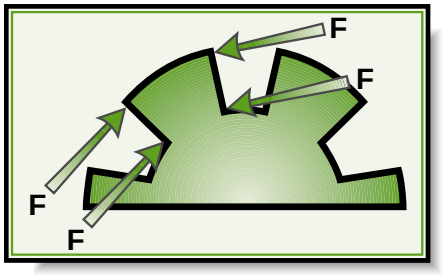
Magnaloy Coupling Design Features



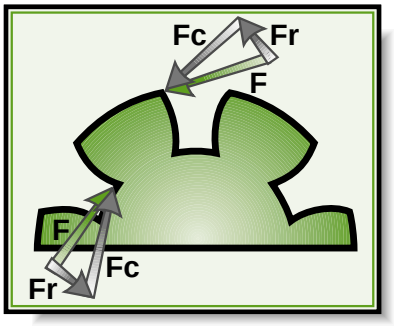
"Load-Lock" Design is simple and effective. The drive-lug configuration is tapered from top to base, as are the mating lugs of the opposing coupling hub. Under load, the insert conforms to the tapers, inter-locking the two hubs. This load-lock design protects bearings and equipment by eliminating end thrust in both directions... and it requires only one set-screw in each hub.

Radial Lug Design is logical and efficient. The most common failure of an elastomeric insert type drive coupling is hysteresis failure of the elastomeric element - breakdown of the elastomer due to cyclical overworking and associated heat generation. Magnaloy Coupling's drive lugs are in a true radial orientation. Applied forces are evenly distributed in the compressive direction only, eliminating the heat generating radial component. True compressive loading reduces internal heat generation and improves elastomer life.

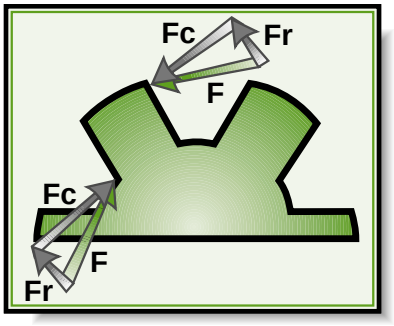




MAGNALOY COUPLING DESIGN
Under loaded conditions, the resultant forces applied on the element segments are evenly distributed in the compressive direction only. This results in no radial forces to multiply the internal heat generation.



CONVENTIONAL DESIGN A
Under loaded conditions this jaw design results in the applied forces exerting components in the compressive and radical directions. These forces change direction and magnitude along the jaw arc which greatly increase the internal movement of the element which causes heat generation.



CONVENTIONAL DESIGN B
This more conventional straight sided jaw design also exerts component forces in the compressive and radial directions when under load. The radial component is outward (acting to extrude the element) and changes in magnitude only, as does the compressive component, along the jaw surface. The component forces resulting from this design also causes increased internal movement in the element.

magnaloy coupling company P.O. Box 455 Alpena, MI 49707 989-356-2186

Premium Flexible Drive Couplings

Magnaloy is the original lightweight, heavy-duty flexible drive coupling. Light weight magnesium construction makes Magnaloy couplings 76% lighter than cast iron and 36% lighter than aluminum units... and they're stronger than either!

The benefits are many... Reduced loads on bearings, shafts and pumps, for longer component life. Easier handling and installation. Rust proof and corrosion resistant.

Magnaloy's close machining tolerances (TIR of .002") assures vibration - free operation and easy, accurate alignment without need for special tools. Solid magnesium alloy permanent mold castings are heat treated and offer the highest strength-to-weight ratio available.

Shaded Area: AGMA semi-standard bore key combinations.

Bore Tolerances

Over	Include	Tolerance
--	1	+.0008/ +.0003
1	2	+.0013/ +.0005
2	3	+.0018/ +.0008
3	4	+.0020/ +.0010
4	5	+.0023/ +.0010

Part Number Usage: Magnaloy Coupling Hub part numbers may be specified using the following format: Start with letter "M" designating Magnaloy, followed by 3 digit Model Code (100, 200, etc.), then the specific 5 digit Bore Key Code.

Example: Model 500 hub with a 1 3/8 bore and 5/16 keyway would be specified as: M50011210 - No bore hubs are designated as 'R' code, ie: M500R.

Additional Coupling Specifications

Model Number	100	200	300	400	500	600	700	800	900
Maximum Bore	1-1/8	1-3/8	1-5/8	1-7/8	2-3/8	2-5/8	2-7/8	3-7/8	4-3/4
Complete Coupling Approx. Wght. (Solid Hub)	3/4	1	2	3	4	7	12	18	38
Number of Drive Lugs	3	3	3	3	4	6	6	6	6
Hub Movement for Insert Removal	.74	.74	.75	.98	1.12	1.02	1.50	1.63	2.27
Basic Insert Number	170	270	370	470	570	670	770	870	970

magnaloy coupling company P.O. Box 455 Alpena, MI 49707 989-356-2186

Magnaloy Coupling's full range of flexible inserts permit custom design performance for a wide range of applications. All insert materials offer complete electrical insulation, as Magnaloy's design eliminates all metal-to-metal contact.

Part Number Usage: Magnaloy Coupling Insert part numbers may be specified using the following format: Start with letter 'M' designating Magnaloy followed by 3 digit insert model size (170, 270, etc.) then the specific material code letter. If an optional durometer is being specified, after the material code letter supply the durometer number divided by 10.

EXAMPLES: Urethane insert for Model 300, M370U; 80 Duro Neoprene for Model 200, M270N8.

Neoprene (Code N) - Black material - Standard material with Magnaloy Coupling. Good general purpose material offering good resiliency and load capabilities. Temp range -30°F to +250°F (-34°C to =121°C) optional 80A durometer (painted gold) and 90A durometer (painted silver) are available for slight increased load capability and less resiliency.

Nitrile (Buna N) (Code B) - Painted blue - Excellent material with petroleum products. Excellent compression set and abrasion resistance characteristics. Temp range -60°F to +250°F (-51°C to +121°C).

Urethane (Code U) - Yellow
Excellent mechanical and physical properties. Offers good medium duty durability and resiliency. Urethane tends to soften in higher temperatures and humid conditions. Temp Range -30°F to +150°F (-34°C to +66°C).

Viton (Fluorocarbon) (Code V) - Red material - Excellent fluid compatibility and high temperature characteristics. Good compression set and resiliency. Temp range -20°F to +350°F (-29°C to +177°C).

Hytrel (Code H) - Blue-green material - Superior physical and mechanical properties and excellent fluid compatibility and high temperature characteristics. Hardness (50D) approaches that of plastic and offers little resiliency. Excellent performance under heavy duty conditions. Temp range -65°F to +300°F (-54°C to +149°C).

Other materials are available for special applications. Consult factory for recommendations and availability.

Service Factors - Load Characteristics

Load Classification	Type of Prime Mover			
	Standard Motor or Turbine	High Torque Motor	I.C. Engine 6 or more cyl.	I.C. Engine less than 6 cyl.
Uniform (U)	1.0	1.5	1.5	2.0*
Moderate (M)	1.5	2.0	2.0*	2.5*
Heavy (H)	2.0*	2.5*	2.5*	3.0*

Uniform Load: Steady loading, non-reversing, torque does not exceed rating.
Moderate Load: Uneven loading with moderate shock, frequent starts, infrequent reversals, peak torque may exceed average rate of prime mover by 125%.
Heavy Load: Uneven loading with heavy shock, frequent reversals, peak torque may exceed average rating of prime mover by 150%.
*Recommend use of Urethane or Hytrel Insert.

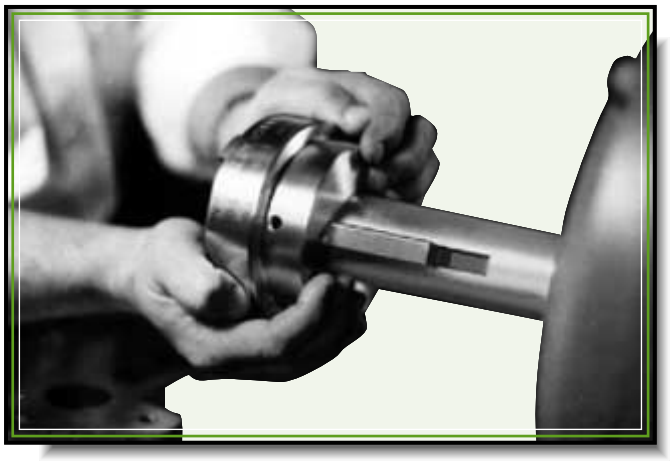
Selection Method

1. Several specifics must be considered to make the best choice of couplings:
   A. Type of prime mover and load characteristics (see table above).
   B. Shaft diameter and key size or spline configuration (No. of teeth, pitch ratio, pressure angle).
   C. Horsepower rating of loads to be transmitted.
   D. Maximum operating speed (rpm).
   E. Maximum operating misalignment.
   F. Clearance limitations.
2. Calculate effective hp/100 rpm by use of table above and select the minimum size couplings recommended.
3. VERIFY YOUR SELECTION:
   A. Check for maximum bore size.
   B. Check dimensions for adequate clearance.
   C. Indicate any special insert specification and/or coupling coating for environmental protection, if required.

   Equation: Effective HP per 100 RPM = rated HP x Service Factor x 100/RPM

   Example: 150 HP 4 cyl. Diesel Engine Driving Reciprocating Irrigation Pump operating at 3250 RPM
   Service Factor = 3.0 (Hytrel Insert recommended)
   Eff. HP per 100 RPM = 150 HP x 3.0 x 100/3250 RPM = 13.85 HP/100 RPM Model 600 rating with Hytrel Insert is 23.7 HP/100 RPM

NOTE: Above service factors are intended for use as a general guide only.
* Recommend use of Steel Bushing and Clamp with Splined Bores.



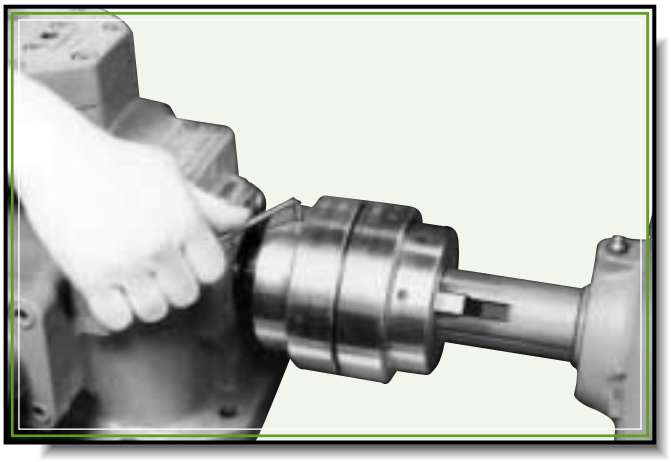
Shaft spacing should be within range given by dimensions 'W' and 'X' as shown in charts on page 4.

Position each hub on proper size shaft - Magnaloy couplings are bored to standard "push fit" tolerances, if a tight fit exists check shaft for burrs.

Maximum benefits are obtained with hubs positioned to allow complete shaft engagement within bore. However, some equipment designs do not permit this condition - maximum shaft engagement should be utilized in any case.

Alignment - Place a straight edge (scale) at top and side of coupling. Use a .005 inch feeler gauge under scale for final inspection. This will indicate accurate parallel and angular alignment.

Magnaloy's precision tooled outside surfaces permit this simple, but accurate alignment method.



Secure equipment mounts and recheck alignment for movement.

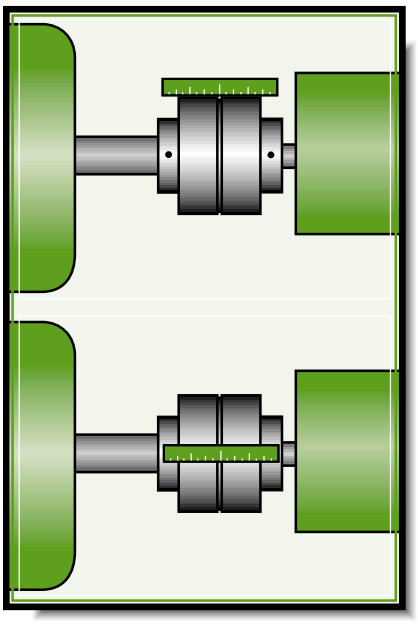
Install the insert in the coupling positioning hubs in contact with lip around outside of insert.

Before tightening set screws, run the coupling and check for separation of hubs or creep . Recheck alignment and tighten set screws.

With the Steel Bushed/Clamp type couplings, to facilitate installation on the shaft, it may be necessary to slightly loosen the set-screw over the keystock. When securing the coupling to the shaft, first tighten the clamp bolt, then tighten the set--screw against the keystock.

Mis-Alignment Capabilities

Magnaloy couplings offer four-way flexibility (parallel, angular, axial and torsional) and require no lubrication. They are easily installed and properly aligned without use of special tools or equipment - a straight edge and hex wrench are the only tools required. Magnaloy's insert reduces noise and vibration and permits needed flexibility for proper operation within alignment capabilities.



Recommended Torques for Fasteners

Model	Set Screw	Clamp Screw
100	60-70 in. lbs.	130-140 in. lbs.
200	130-140 in. lbs.	130-140 in. lbs.
300	130-140 in. lbs.	210-220 in. lbs.
400	190-200 in. lbs.	210-220 in. lbs.
500	190-200 in. lbs.	300-310 in. lbs.
600	190-200 in. lbs.	35-36 ft. lbs.
700	300-310 in. lbs.	35-36 ft. lbs.
800	300-310 in. lbs.	49-50 ft. lbs.
900	100-110 ft. lbs.	100-110 ft. lbs.

Intended as a general guide for fastener torques with Magnaloy Couplings.

Perfect alignment of equipment shafts, in most cases, is impractical to obtain or maintain, and misaligned equipment produces excess stress on bearings and coupling. Magnaloy's insert design will accept misalignment strain and, when excessive, will cause insert wear as a visual and audible indication of misalignment problems. However, Magnaloy's inserts are inexpensive and easily replaced; under normal conditions the insert seldom requires replacement.

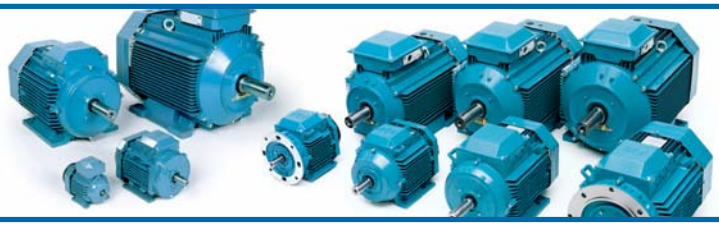
– Made in ABB



Certified for Global Use

Global motors are certified, labeled and fulfill requirements for global use:

CE = European safety certified

EFF1 = European Community efficiency classification, highest class EFF1

CSA = Canadian safety certified

EEV = Canadian Energy Efficient certified

UR = US safety certified

EPAct = US Energy Efficiency certified.

Ratings

- Rated for use on both 50 Hz and 60 Hz systems
- Voltage ratings covering the world with one and the same motor
- Efficiency and safety ratings meeting or exceeding all mandatory requirements

Advantages

- One motor design in stock ready to ship anywhere in the world
- No problem moving production equipment internationally
- Easy to specify – fulfills all requirements globally
- Reduced operating costs thanks to high reliability and low losses
- IEC – CENELEC harmonized
- Backed by the extensive collection of ABB application knowledge

Quality

Quality, Reliability, Service & Support, from the worldwide leader in motors, ABB.

EFF 1

EPAct

Global motors according to EFF1, EPAct, CSA, EEV, UR

It’s the details that make the difference

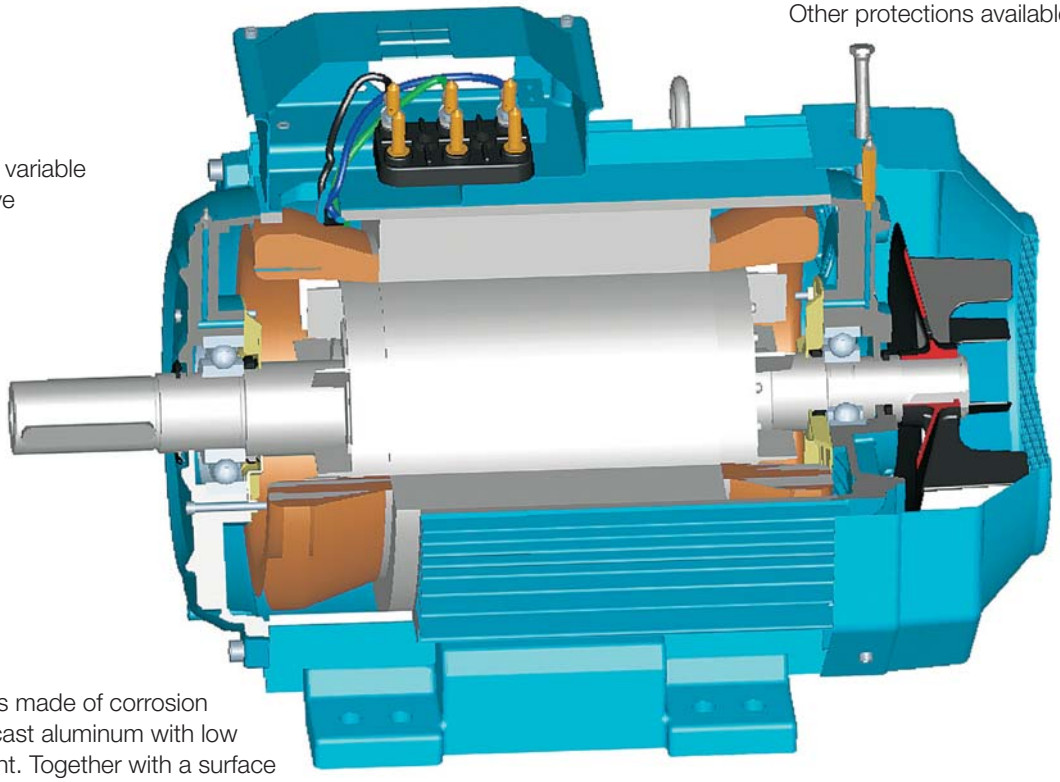
■ Designed, certified and labeled to meet the safety requirements according to CE, UL/UR and CSA, and the efficiency requirements according to CE, EFF1, EPAct and CSA/EEV.

■ Terminal box with 6 lead terminal board, the winding can be connected in either D or Y configuration. The terminal box has plenty of space and is designed for easy and secure installation.

■ Degree of protection/Enclosure: IP 55/Totally enclosed (TEFC) WaterProof Motor
- Protected against Dust/Limited ingress permitted (no harmful deposit)
- Protected against low pressure jets of water from all directions/Limited ingress permitted.

Other protections available on request.

■ Suitable for variable frequency drive applications.



■ The frame is made of corrosion resistant die-cast aluminum with low copper content. Together with a surface treatment and final powder painting with Epoxy/Polyester powder, it gives a very high corrosion protection suitable for industrial applications, indoors and outdoors.

■ Reliable grease-lubricated ball bearings with C3 clearance as standard, designed for low running temperature and long service life.

■ Made by ABB according to the highest quality standards.

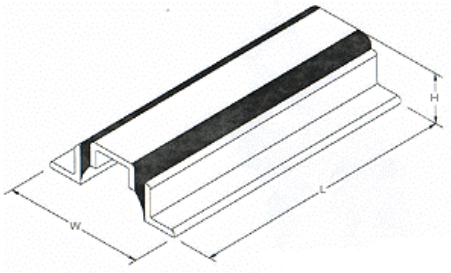
VibraSystems Inc.

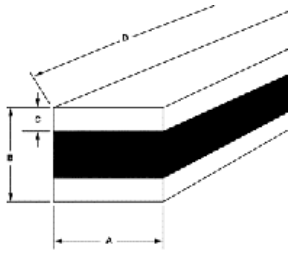
FSM / SM Series
SANDWICH MOUNTS

VibraSystems channel mounts, type FSM, are versatile anti-vibration bars where both the top C channel and bottom angle flanges are accessible from both sides. This configuration allows the top and bottom plates to be drilled anywhere along their length for ease of installation. The plates are bonded together with neoprene elements, which allow up to 3/8" deflection at the maximum load of 50 psi.. Available in standard or custom-made lengths.



Product Code	Dimensions (ins)			Max Load (lbs)	Max Load (lbs / inch)
	L	W	H		
FSM-4	4	4-1/2	1-5/16	200	50
FSM-6	6	4-1/2	1-5/16	300	50
FSM-12	12	4-1/2	1-5/16	600	50
FSM-40	40	4-1/2	1-5/16	2000	50

VibraSystems type SM Sandwich Bars consist of two metal plates bonded with a neoprene insert. SM mounts effectively isolates against horizontal and vertical shock and vibration. SM mounts can be made in custom lengths up to 48" and also in custom widths and thickness. Threaded holes in the metal plates can be supplied on special orders.



Product Code	Dimensions (ins)				Max Load (lbs)
	A	B	C	D	
SM-1-(D)	2	1-3/4	3/8	2, 4, 6, 12, 40	800/1"
SM-2-(D)	3	2	3/8	3, 6, 12, 40	1100/1"
SM-3-(D)	4	2-3/8	5/8	4, 8, 12, 40	1400/1"

FEATURES:

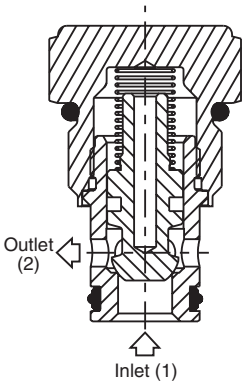
- **Low installation height provides good stability**
- **Effectively isolates against horizontal and vertical vibration and shock**
- **High deflection in the horizontal plane while vertical deflection is low**
- **Resistant to oil and grease**
- **Strong, reliable construction provides long life**
- **Increases machine accuracy and extends life of machinery and tools**

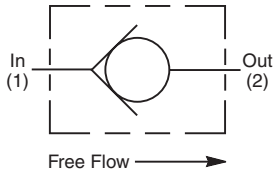
General Description

Cartridge Style Check Valve. For additional information see Technical Tips on pages CV1-CV4.

Features

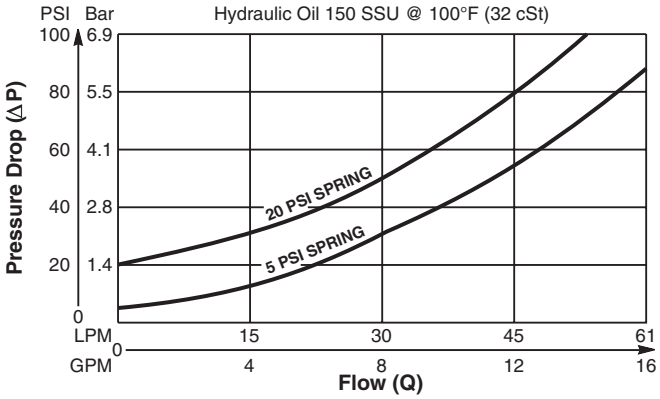
- Spherical poppet for low leakage
- "D"-Ring eliminates back-up rings
- Dual sense paths for reduced ΔP
- All external parts zinc plated



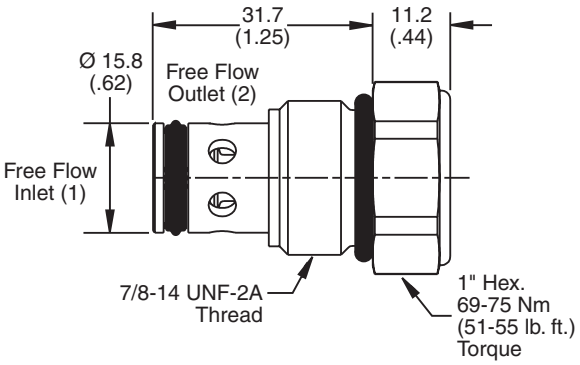


Performance Curve

Pressure Drop vs. Flow (Through cartridge only)



Dimensions Millimeters (Inches)



Specifications

Rated Flow	60 LPM (16 GPM)
Maximum Inlet Pressure	350 Bar (5000 PSI)
Leakage at 150 SSU (32 cSt)	2 drops/min. (.13 cc/min.) at 350 Bar (5000 PSI)
Cartridge Material	All parts steel. All operating parts hardened steel.
Operating Temp. Range/Seals	-45°C to +93.3°C ("D" Ring) (-50°F to +200°F) -31.7°C to +121.1°C (Fluorocarbon) (-25°F to +250°F)
Fluid Compatibility/ Viscosity	Mineral-based or synthetic with lubricating properties at viscosities of 45 to 2000 SSU (6 to 420 cSt)
Filtration	ISO code 16/13, SAE Class 4 or better
Approx. Weight	.09 kg (0.2 lbs.)
Cavity	C10-2 (See BC Section for more details)
Form Tool	Rougher None Finisher NFT10-2F

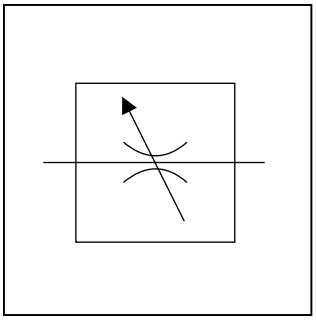
General Description

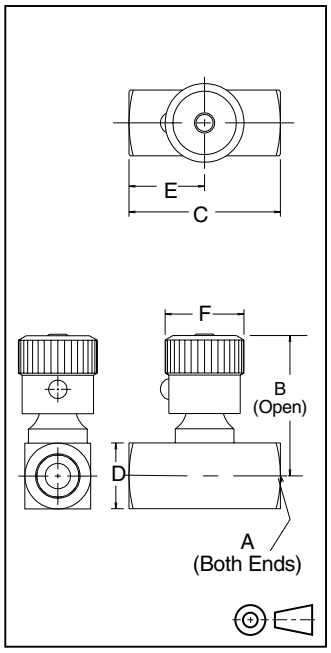
Series PN Needle Valves provide excellent speed control for pneumatic and hydraulic applications where a reverse flow check is not required.

ParTrol valves are standard with a two step needle. Fine metering is accomplished over the first adjustment turns and nominal metering is provided over the last turns. Once the desired flow is selected, a set screw can be tightened to hold the setting.

These valves are available with NPTF ports in 1/8", 1/4", 3/8" and 1/2" sizes. Additionally, SAE ported valves are available in SAE 6 and SAE 8.

Brass valves are recommended for pneumatic service. Steel valves are recommended for hydraulic service.





Specifications

Maximum Operating Pressure	Brass (ASTM B-16), 138 Bar (2000 PSI) Steel* (ASTM 12L14), 345 Bar (5000 PSI)
Component Materials	Needle (ASTM 416), Stainless Steel Needle Seals: Standard — Nitrile Optional — Fluorocarbon Knob (ASTM 2024-T351), Aluminum
Cracking pressure for return check poppet	.35 Bar (5 PSI) Nominal

* Steel valves are zinc plated and sealed with clear dichromate.

PPC | Process Gauge

1. Optional Hinged Case
2. Optional Flush Mounting Ring

RoHS compliant

Note: RoHS applies only to SS internals version

Description & Features:

- Field liquid-fillable, phenolic solid front blowout back safety case
- ±0.5% accuracy
- Stainless steel full rotary movement for longer life
- Micrometer pointer for ease in calibration
- Under and overload stops
- 316L stainless steel, brass, Monel® or carbon steel wetted parts
- Restrictor screws standard on dual scale (optional on single scale gauges)
- CRN registered
- 5 year warranty

Applications:

- Used where operator safety is a must
- Ideally suited for process, chemical and petroleum industries
- Highly corrosive media

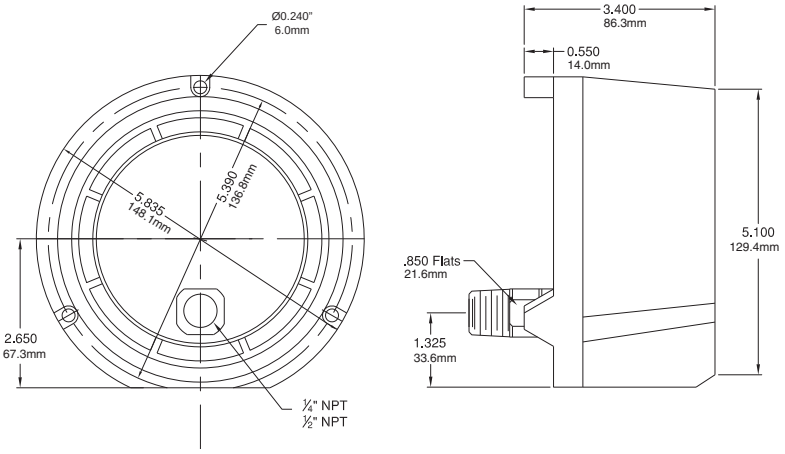
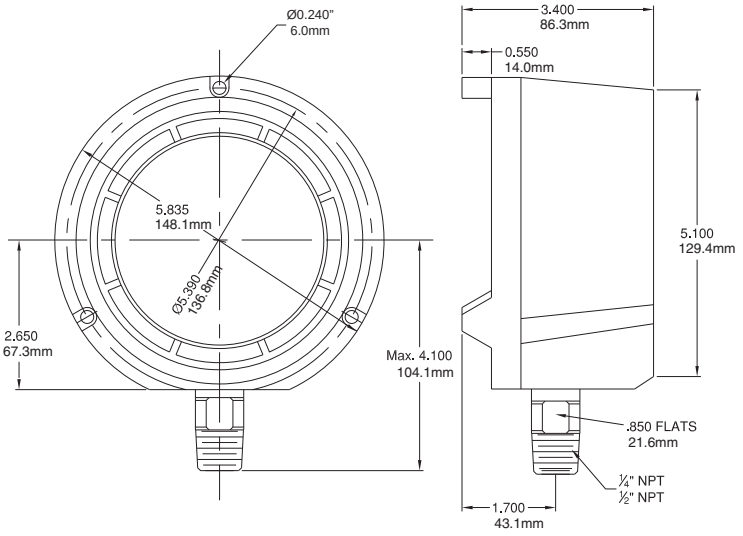
4.5” Back Connection



4.5” Bottom Connection



General Description

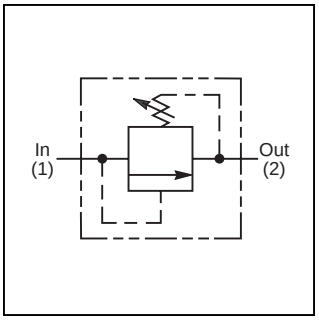
The RAH101 Series, Pilot Operated, Spool-Type Relief Valves are suited for continuous duty applications and are primarily used to limit main system pressure.

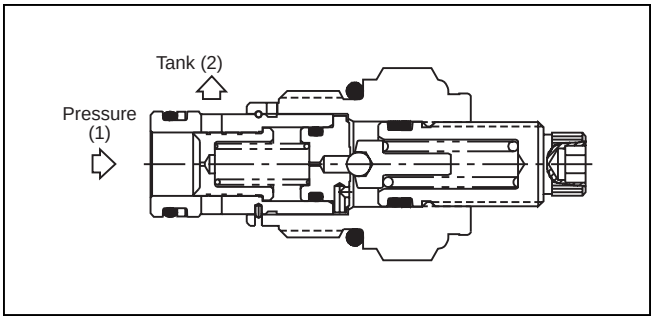
Operation

When inlet pressure exceeds the valve setting, the pilot section opens. This pilot flow creates a pressure imbalance across the main section causing the valve to open, permitting relief flow to tank.

Features

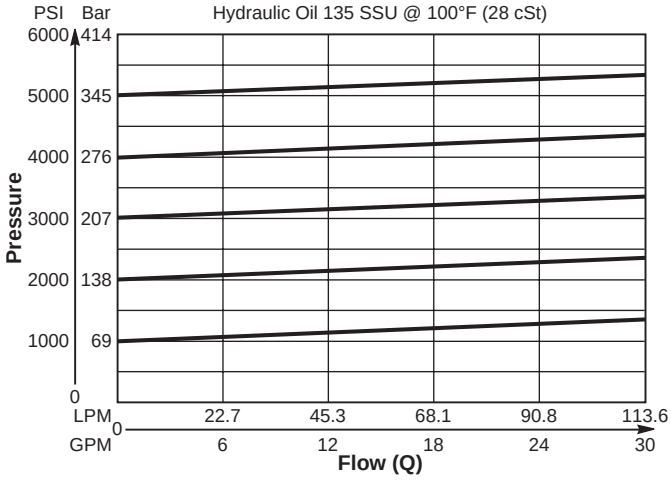
- Low override curve
- Ball-type pilot for added stability
- High accuracy - pilot operated design
- Hardened, precision ground parts for durability
- Compact size for reduced space requirements
- All external parts have yellow zinc dichromate. This coating allows them to withstand a 200 hour salt spray test.





Performance Curve

Flow vs. Inlet Pressure
(Pressure rise through cartridge only)

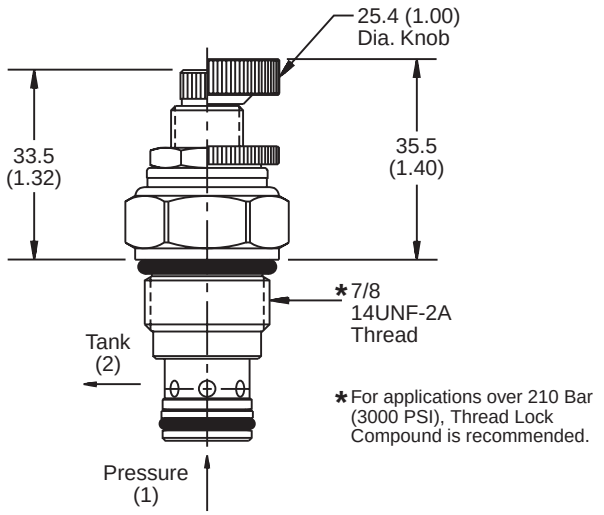


Specifications

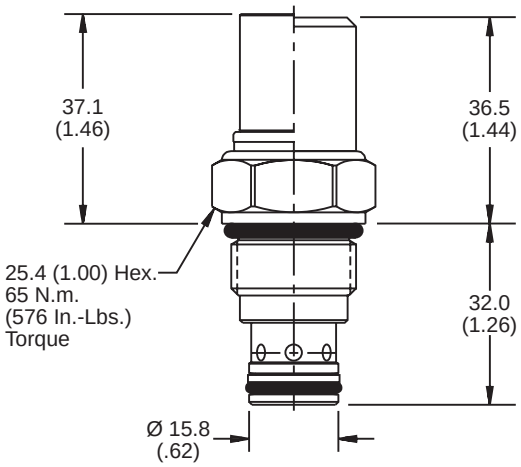
Rated Flow	112.5 LPM (30 GPM)
Maximum Inlet Pressure	380 Bar (5500 PSI) - Steel 210 Bar (3000 PSI) - Aluminum
Maximum Setting Pressure	345 Bar (5000 PSI) - Steel 210 Bar (3000 PSI) - Aluminum
Reseat Pressure (Valve returns to non-relieving mode)	80% of crack pressure
Operating Temp. Range (Ambient)	-40°C to +93.3°C (Nitrile) (-40°F to +200°F) -31.7°C to +121.1°C (Fluorocarbon) (-25°F to +250°F)
Cartridge Material	All parts steel. All operating parts hardened steel.
Body Material	Steel or Aluminum
Filtration	ISO Code 16/13, SAE Class 4 or better
Mounting	No restrictions
Cavity	Common Cavity No. C10-2

*Inch equivalents for millimeter dimensions are shown in (**)

Cartridge Only

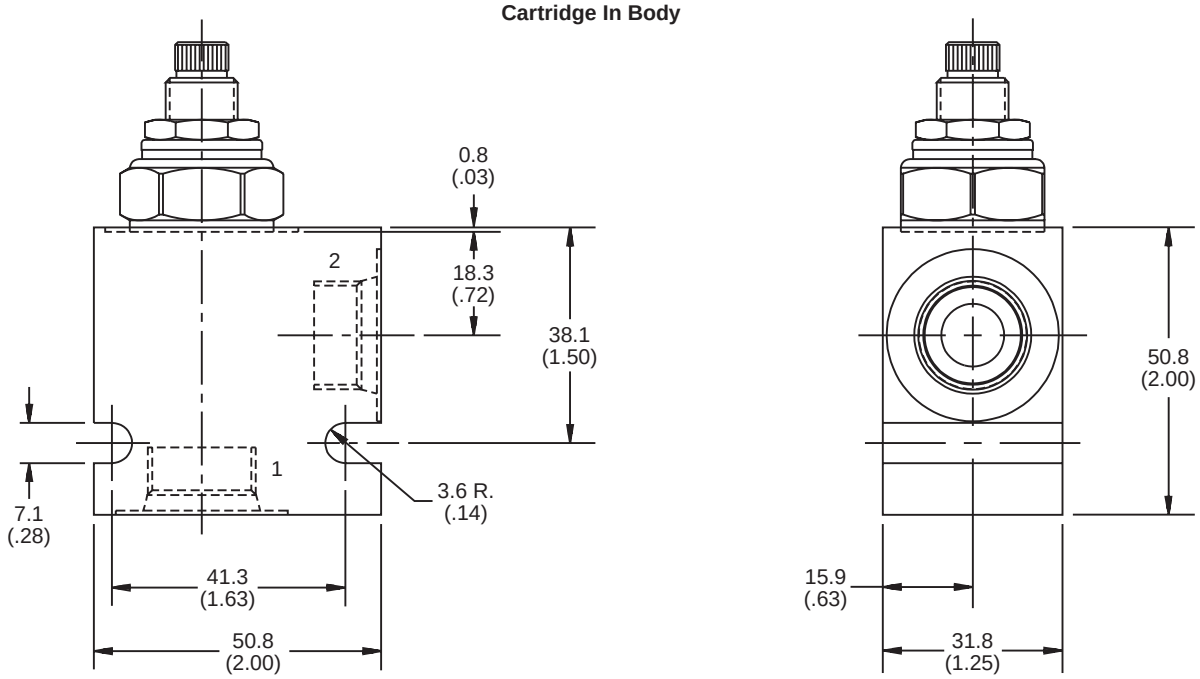


Screw/Knob Version



Fixed Cap/Tamper Resistant Version

Cartridge In Body



Note: Static pressure in Port 2 to be 210 Bar (3000 PSI) maximum.

15P/30P Series

High Pressure Filters

Applications for 15P/30P Series filters

- Saw mills
- Aircraft ground support equipment
- Asphalt pavers
- Hydraulic fan drives
- Power steering circuits
- Waste trucks
- Cement trucks
- Servo control protection
- Logging equipment

These application examples have one thing in common...the need for clean hydraulic fluid.

Modern high pressure hydraulic systems are demanding. Better controls and long component life are expected. To deliver the high standards of performance, hydraulic components are built with tighter tolerances which increases their sensitivity to contamination.

That's where Parker pressure filters come into play. They filter out ingressed contamination before it jams a valve or scores a cylinder. They block pump generated debris before it gets to servo or proportional valves. Parker pressure filters are a key ingredient in meeting today's system demands.

Put your hydraulic systems in the care of Parker Hydraulic Filter Division. We are committed to designing and building the best filters available to industry.

Indicators
- Both visual auto reset style and dual indicator visual/ electrical style available to suit your application. New patented design resists false signaling due to vibration.

Straight Thread Ports
- SAE straight thread for positive sealing

Bypass Valve (not visible)
- May be blocked for critical applications

Bowl Construction
- Formed of high grade 6061 T6 aluminum
- Black anodized, corrosion resistant finish
- Knurled for easier gripping when removing and re-assembling

Hex (not visible)
- Hex formed at base of bowl for easy removal

Bowl Configurations
- Single and double length bowls available to cover a wide range of flows
- 30P available in a duplex version.

Drain Port (not visible)
- Clean and easy servicing
- Lets you drain bowl before element changes

Quality elements make the difference

The important item in a filter assembly is the element. It must capture and retain contaminants that can damage system components. At the same time it must allow flow to pass as freely as possible to perform it's function.

There are many ways to design and build an element, and it's easy to produce a low cost element. However, cost is not the only selection criteria, especially when the risk is loss of critical machine performance.

For instance, wire mesh reinforcement. Not all filter elements have it. It's used in Parker elements to keep the pleats from bunching or collapsing. If pleats bunch, the effective surface area of the element is reduced, excessive pressure drop develops, and the filter assembly may go into premature bypass mode.

There are many other features that are included standard with every quality Parker element. The table below outlines several.

O-Ring Seal
- Positive sealing for optimum element efficiency

Wire Reinforced Media
- Prevents pleat bunching
- Helps prevent media migration
- Maintains media efficiency

Zinc Dichromate End Caps (15P)
- Excellent corrosion protection
- Strong adhesion means no element separation

Engineered Element Design
- The right combination of pleat depth and number of pleats means lower pressure losses (longer life)
- Dirt holding capacity is maximized for less frequent element change-out

Elements for Every Application
- Standard Microglass III media for long life and excellent system protection

Feature	Advantage	Benefit
• Wire reinforced Microglass III elements	• Rugged construction, stands up to abuse of cyclic flows without performance loss • Wire support reduces pleat bunching, keeps pressure drops consistent	• The reliable filtration provided assures equipment protection, reduces down-time, maximizes element life, and allows the hydraulic system to operate properly
• Multipass tested elements (per ANSI/NFPA T3.10.8.8 R1-1990)	• Filter performance backed by recognized and accepted laboratory test standards	• Filters you select have known performance levels
• Complete element performance data disclosure	• All pertinent information is provided in an easy-to-compare format	• Provides an easy guide to proper filter selection

30PD Duplex Filter

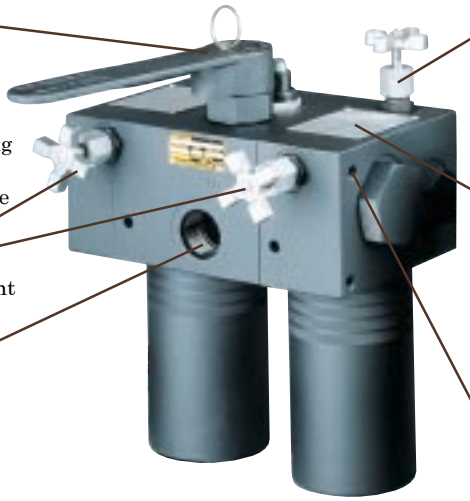
The Parker 30PD duplex pressure filter provides uninterrupted filtration for equipment that cannot be shut down for servicing.

The 30PD allows you to simply switch the diverter valve and service the element while the other side is in service.

Pressure balancing valves and check valves are all neatly assembled in a compact manifold head that makes operation safe, smooth and easy.

Vent valves are also included to insure that all air is purged during service so that maximum system performance is achieved.

The Parker 30PD makes use of industry proven components. Elements are multi-pass tested in accordance with ANSI/NFPA T3.10.8.8 R1 -1990. Bowls and head are subjected to rigorous fatigue testing to insure a trouble free service life.



30PD Empty Housing Flow vs Pressure Loss

To obtain total filter assembly pressure loss, add empty housing loss to the pressure loss of selected element on 30P element performance pages.

Element Servicing

15P/30P

A. Stop the system's power unit.
B. Relieve any pressure in the filter line and drain filter bowl if drain port is provided.
C. Loosen and remove bowl.
D. Remove element from housing.
E. Place new, clean element in housing, centering it on the element locator.
F. Inspect the bowl o-ring and replace if necessary.
G. Install bowl and tighten to specified torque.

30PD

A. Arrow on diverter handle points to the on-duty chamber.
B. Open off-duty vent valve (vent port should be plumbed back to reservoir).
C. Open balance valve slowly to admit fluid into off duty chamber.
D. When fluid is discharged from vent port, close and tighten.
E. Pull up on detent pin and rotate diverter approximately 90° until detent relocates in seat.
F. Close and tighten balance valve.
G. Open new off-duty vent valve to relieve pressure.
H. Follow steps C-G from 15P/30P instructions above.
I. Close and tighten vent valve.

Warning: Do not try and rotate handle until you equalize pressure with the balance valve.

HOW TO ORDER:

Select the desired symbol (in the correct position) to construct a model code.
Example:

10Q*	***Microglass III***
05Q	***Microglass III***
02Q*	***Microglass III***

Note: For high collapse rated (2000 psid) elements, add "H" behind Q. For Microglass media only. *For 3000 psid collapse rated elements, add "X" behind Q.

BOX 5: Indicator

Symbol	Description
N	No indicator, no pressure port
P	***Port plugged***
M2	***Visual auto reset***
H	Electrical indicator, w/½"-14 NPT connection and 12" leads
E	Electrical/visual w/ ½" NPT conduit connection and wire leads
E2	***Electrical/visual (DIN 43650 Hirschman style connection)***
E3	Electrical/visual (ANSI/ B93.55M 3-pin Brad Harrison style connection)

Note: For side mount indicators, place a "s" after indicator symbol. Not available on 30PD model.

BOX 6: Bypass Or Indicator Setting

Symbol	Pressure Setting
50	***50 psid***

Note: If "no bypass" option (-11) and an indicator is selected, "50" denotes indicator calibration.

BOX 7: Ports

Model	Symbol	Description
15P	***MM***	***SAE-12***
15P	XX	¾"-manifold porting
30P	***NN***	***SAE-16***
30P	XX	1"-manifold porting
30PD	NN	SAE-16

Note: Customer supplies subplate adaptor, or purchases optional Parker subplate.

BOX 8: Options

Symbol	Description
1	***None***
11	No bypass
19	SAE-5 drain port on bowl
21	No bypass and drain port

BOX 9: Design Number

Applied to filter assembly by Parker Filter Division. Use the full filter model code, including the design number when ordering replacement parts, elements and cartridges.

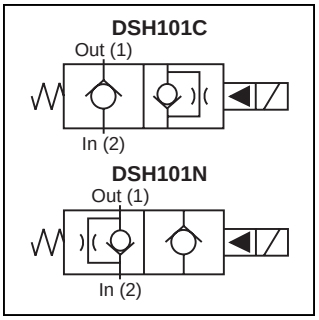
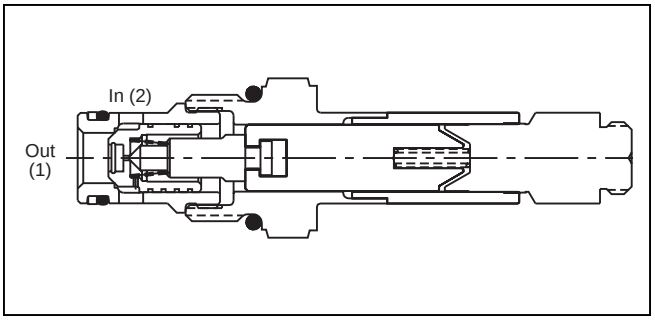
General Description

The DSH101C and DSH101N 2-way, poppet-type, solenoid valves are used in applications requiring on/off valves and low leakage. Single acting cylinder applications typically utilize valves of this type. Valves can be used for bleed down flow and/or raising and lowering a vertical cylinder. Normally open and normally closed configurations plus manual overrides are available.





Operation

Normally Closed

The valve pilot is held on its seat by spring force, blocking pilot flow. This allows pressure at the inlet to hold the poppet on its seat, thus, preventing flow through the valve (inlet to outlet). When the coil is energized, the valve pilot is pulled off its seat. This vents pressure inside the poppet to the outlet port, creating a pressure imbalance across the main poppet which allows flow from the inlet to the outlet.

Normally Closed, Fast Response

The operation of this version is identical to the normally closed valve except for the travel of the poppet. The distance that the poppet travels is much shorter. This gives the fast response valve a faster opening time and a reduced maximum flow rate.

Normally Open

The valve pilot is held off of its seat by spring force. Pilot flow is vented to the outlet port, creating a pressure imbalance that moves the main poppet off it's seat, allowing flow from the inlet to the outlet. When the coil is energized, the valve pilot and main poppet are forced to close, thus blocking flow from the inlet to the outlet.

Features

- Low hysteresis
- Replaceable, one piece encapsulated, coils with minimal amperage draw
- Variety of coil terminations and voltages
- Variety of manual override options available

Specifications

Rated Flow	**DSH101CH** & **DSH101CHR** 30 LPM (8 GPM) **All other versions** 60 LPM (15 GPM)
Maximum Inlet Pressure	345 Bar (5000 PSI) - Steel 210 Bar (3000 PSI) - Aluminum
Leakage	10 drops/min. (2/3 cc/min.) at 345 Bar (5000 PSI)

Moduflow™ *Plus* Series

ILP and RFP Low Pressure Filters

Applications for Moduflow Filters

- Power Unit Fabrication
- Off-line Filter Loops
- Mobile Equipment

The Moduflow filter is widely considered the most versatile filter available on the market. The unique diverter valve assembly, and inside to outside flow through the element, allows the Moduflow to be configured for in-line, in-tank or suction filtration.

The flow diverter minimizes turbulence and pressure loss through the filter, improving system performance.

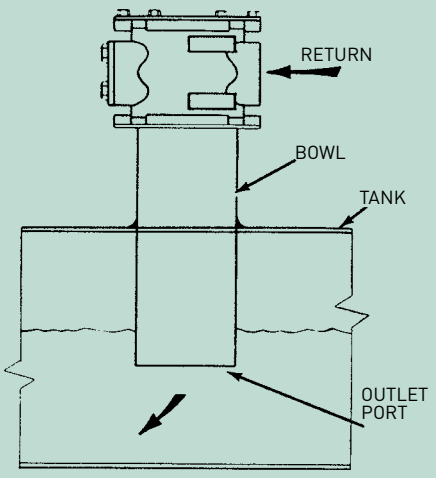
The newly designed closed bottom elements for the RFP and ILP models insures all contamination remains trapped within the element as the filter is serviced.

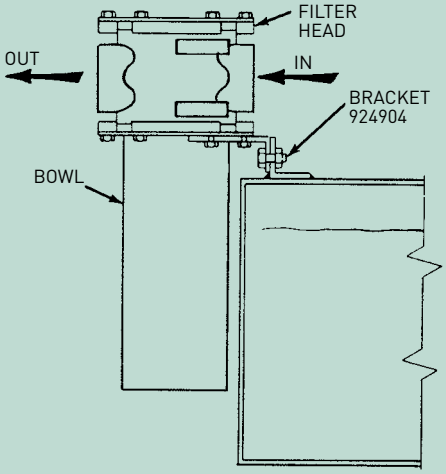
A wide variety of visual and electrical indicators allows you to know exactly when the element needs to be serviced. There is even a "no element" indicator that can sense when there is not an element installed in the filter.

From top to bottom, the Moduflow filter series provides the high level of filtration and long term dependability so vital to today's hydraulic systems.

Parker's new patented Moduflow element was designed with built-in diverter cone and bypass valve, to meet your application needs.

Mounting / Porting Styles

RFP Return Filter	ILP In-Line Filter
	




Features

Flanges
- NPT or SAE ¾" to 2"
- Lightweight aluminum

Cover
- Slotted for quick release
- Lightweight aluminum

Indicators
- Visual or electrical
- Mounted on either side
- Optional "no element" indication

Bowl
- Single or double length
- Durable steel construction

Bypass
(not visible)
- Integral bypass replaced with every element change

Element
(not visible)
- Available in cellulose, wire mesh or high performance Microglass II media
- Single or double length

Feature	Advantage	Benefit
• Top access element service	• Oil remains in housing • Quicker elements change	• No Spills • Reduced maintenance costs
• Slotted cover	• Quick release cover • Cap screws remain in housing	• Reduced maintenance costs • No loose parts to lose
• Closed bottom elements	• Removes all contaminant during element service	• No downtime contamination from servicing
• Visual or electrical indicators	• Know exactly when to service elements	• Helps prevent bypass condition • No premature disposal
• Flange face ports	• Flexible mounting (3/4" to 2")	• Easy plumbing to your system

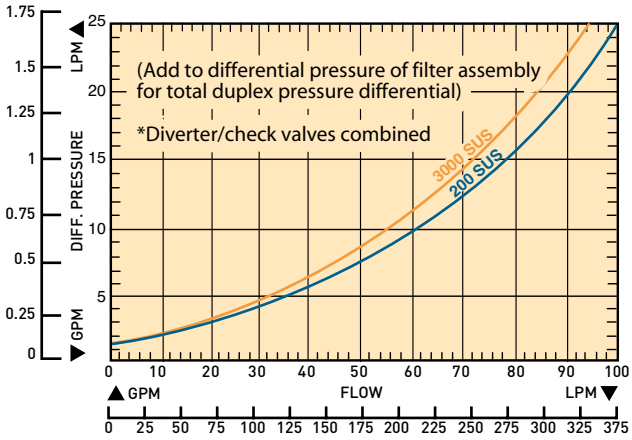
Typical Flow/Pressure Curves For Duplex Valves



Submersible Option

When there is a limited amount of space on the top of the reservoir, the Moduflow filter can be mounted in the side of a reservoir.

A check valve mounted on the filter bowl prevents the reservoir from being drained during servicing of the element. The only fluid drained is from the inside of the filter housing.

For return line applications (RFP), the fluid returning to the reservoir holds the check valve open. When the system is shut down, the check valve closes automatically.

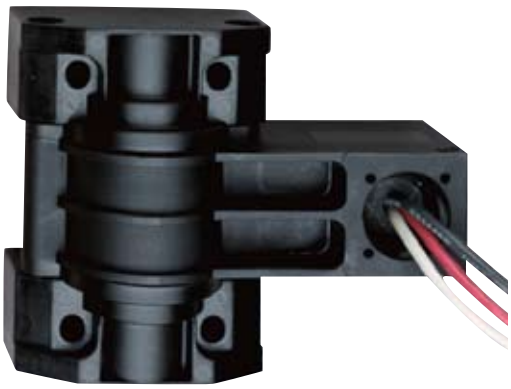
"E" OPTION-ELECTRICAL INDICATOR



Lower Cost than many single unit filters.

Moduflow™ Manifold Extended Filter Range

Use Model MM Manifold to handle return line flows up to 130 gpm.

- Rated static pressure: 300 psi
- Typical burst pressure: 900 psi
- 23 Porting options
- 6 Gage port options
- Easily mounted on ModuFlow™

High Flows At Low Cost

The model MM manifold is designed to extend the flow range of ModuFlow™ Filters when operating with 10 Micron and finer filter media. When mounted to a pair of RFP-2 or ILP-2 filters, this manifold will allow flows up to 130 gpm in return lines (15 fps velocity).
Note: The Model MM manifold is not applicable to suction lines due to its pressure drop characteristics.

When used with two ModuFlow™ filters, the total cost is often less than a single unit filter rated for 130 gpm flow. Tank-top mounted (Model RFP) filters will require only one manifold on the filter inlet pports. In-line mounted (Model ILPav) filters will require two manifolds, one on the inlet and one on the outlet ports.

Multiple Uses

Although designed for manifold ModuFlow™ filters, the Model MM can be used in a variety of applications which require:

- Splitting flow between components
- Connecting multiple lines to a single component

Such applications are frequently encountered on mobile equipment, machine tools, and large lubricating systems. In such applications, use of a manifold can often reduce total piping and installation costs. With 23 porting options, Model MM manifolds will fulfill a wide variety of needs. See "How-To-Order" and installation drawings for port sizes and location options.

Proven Reliability

The rugged design of the Model MM manifold has been proven in demanding mobil equipment applications, At the factory, we have cycle tested the Model MM through the full range of rated flow and pressure to insure reliable service.

Parker Filter Division maintains the same high standards in delivery, quality, and service. Considering this, plus features, flexibility, price, and performance, the Model MM manifold is a valuable addition to your fluid power component list.

For off-the-shelf delivery, contact your local Parker stocking distributor or Parker Hannifin Corporation, Filter Division, 16810 Fulton County Road #2, Metamora, OH 43540, (419) 644-4311.

HOW TO ORDER MANIFOLDS: Select desired port option number for each box.

Model		BOX 1	BOX 2	BOX 3	BOX 4	BOX 5	Box 6	BOX 7	BOX 8	BOX 9	BOX 10
	MM										

ORDERING INSTRUCTIONS

1. Insert option number into appropriate box for each of the port options selected.
2. If standard inlet and outlets are the only ports needed, insert the number "0" in Box 1 and leave the rest blank.
3. Order port o-rings and screws as listed under specifications.
4. If standard inlet will not be used, order blank flange kit, P/N 924781 to seal this port, and order only 8 outlet port screws, P/N 900228.
5. Using manifolds with ModuFlow™ filters:*
   a. Calculate flow through each filter by dividing manifold inlet flow in hlaf.
   b. Find pressure drop across each filter using Catalog 2300 data for the flow found in (a.)
   c. Calculate total energy losses by adding energy loss calculated from manifold flow/ pressure curve.
   d. Find overall installation dimensions by adding manifold dimensions to those in Catalog 2300.

* Tank-top mounted RFP filters will require one manifold on filter inlets: in-line mounted ILP filters will require two manifolds on both inlets and outlets.

Brass Ball Valves Series 500

Advantages

Parker's forged body ball valve provides extended service life and resists failure caused by severe temperature applications. Optimum flow design assures maximum system efficiency. Highly inert PTFE seats and seals provide resistance to chemical corrosion. Parker also provides a blow-out proof stem, chrome plated brass ball and a specially designed handle enabling increased turning leverage for ease of opening and closing. Parker's ball valve can be readily identified assuring high quality engineering and reliability. This economical ball valve is available in female pipe sizes. Parker's ball valve bodies are machined from high quality CA 377 forgings.

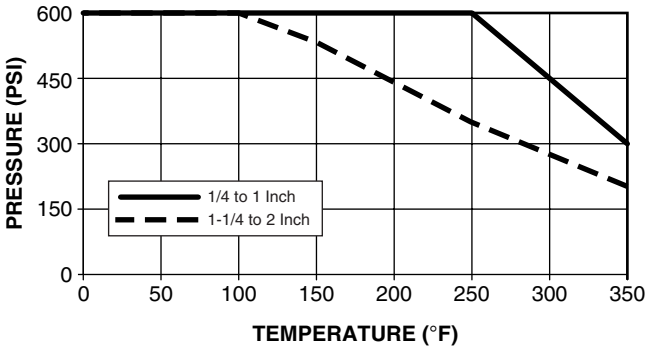
Applications

Parker's industrial ball valve product line is intended for general purpose use. Please be aware that ball valves are intended for use in the fully open or closed positions. Depending on application conditions, throttling of the valve may result in premature seal failure and/or inability to turn the valve handle.

For use as fuel line shutoffs for gasoline and diesel powered over the highway, off highway, and construction equipment vehicles. Water and air service lines on capital equipment and plant design plumbing that require total shutoff capability.

Working Pressure and Temperature

Saturated steam service up to 150 PSI and 400° F
Vacuum, 29 Inches of Mercury
Vented up to 250 PSI



Operating Instructions

Quarter turn is "ON" or "OFF".
(Provides positive stop action for full shutoff.)

NOTE: PERIODICALLY CHECK THE ADJUSTABLE PACKING NUT AND TIGHTEN AS REQUIRED.

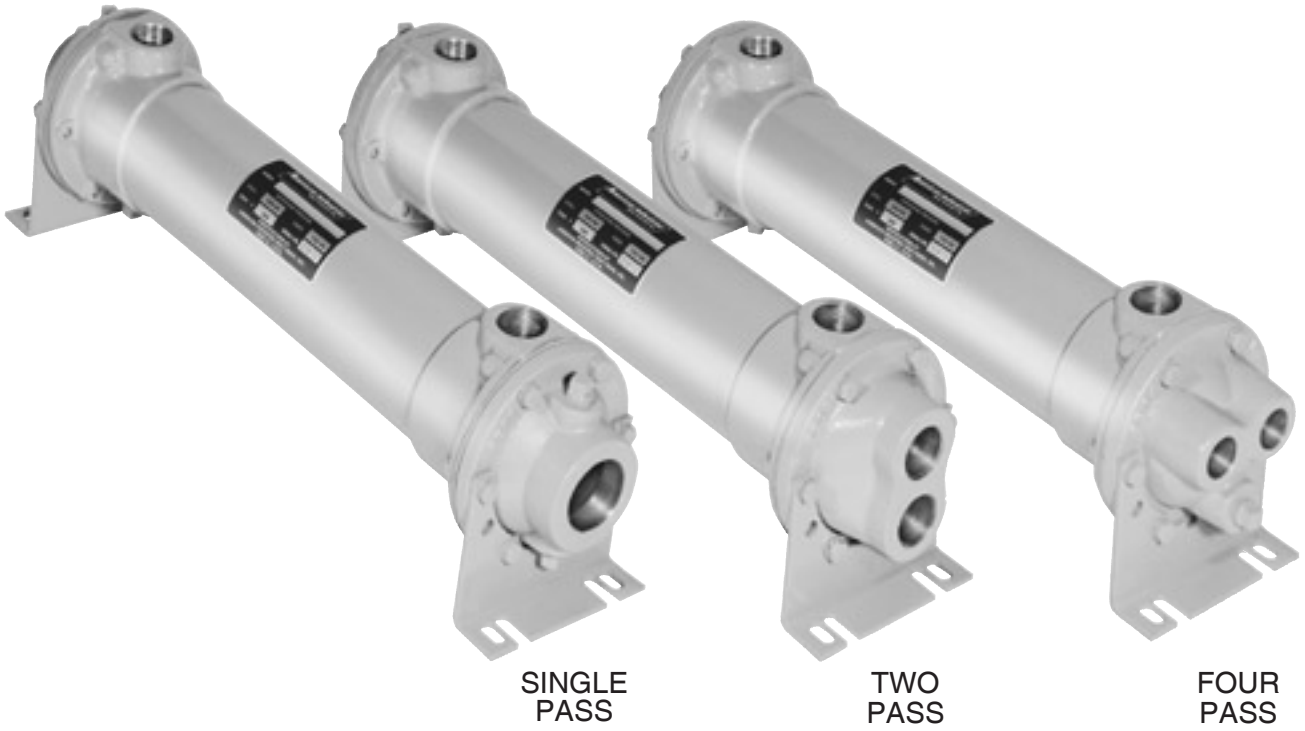
J

American Industrial Heat Transfer Inc.®

Manufacturer of Quality Heat Exchangers

AB - SAE - STS - EAB SERIES



Fixed Tube Bundle / Liquid Cooled

HEAT EXCHANGERS

- Operating pressure for tubes 150 PSI.
- Operating pressure for shell 300 PSI.
- Operating temperature 300 °F.
- Can be customized to fit your needs.
- Cools: Fluid power systems, rock crushers, presses, shears, lubrication equipment for paper machinery, gear drives, marine transmissions, etc.

note: AIHTI reserves the right to make reasonable design changes without notice.
Copyright © 2004 American Industrial Heat Transfer, Inc.
3905 Route 173 Zion, IL 60099 tel: 1 (847) 731-1000 fax: 1 (847) 731-1010 www.aihti.com

AB, SAE, STS, & EAB Series *overview*

AB Series

Fixed tube construction heat exchangers with NPT connections. Made of brass with copper cooling tubes and cast iron end bonnets. Standard sizes from 2" through 8" diameters, and from 1.4 to 308 sq.ft. Standard one, two, and four pass models are available. Options include 90/10 copper nickel and 316 stainless steel cooling tubes, bronze bonnets and zinc anodes. Can be customized to fit your requirements.

Optional 10" diameter units in brass are available upon request.

SAB Series

Similar to AB series with the exception of steel shell material. For use in applications where the shell fluid is non-corrosive with steel. Offered in 5" through 8" shell diameter.

SAE Series

Similar to AB series with the exception of the shell ports. SAE series from 2" through 6" diameter has SAE O-ring strait thread shell port connections. Size 8" diameter has SAE code 61 four bolt flange shell port connections.

SSAE Series

Similar to SAE series with the exception of steel shell material. For use in applications where the shell fluid is non-corrosive with steel. *Offered in 5" through 8" shell diameter.*

STS Series

Similar in design to AB series with fixed tube construction and NPT connections made of all 316 stainless steel. Standard sizes from 2" through 8" diameters, and from 1.4 to 308 sq.ft. Standard one, two and four pass models are available. Larger diameters available upon request. Can be customized to fit your requirements.

EAB Series

Expansion bellow minimizes the effects of differential expansion and contraction between the shell and cooling tubing, prolonging the overall life of the heat exchanger by reducing fatigue. Fixed tube construction heat exchangers with NPT connections. Made of brass with 90/10 copper nickel cooling tubes, stainless steel expansion bellows, and cast iron end bonnets. Standard sizes from 3.5" through 8" diameters, and from 3.6 to 308 sq.ft. Standard one, two and four pass models are available.

TUBE JOINT
Roller expanded tube joint to integral forged hub.

THREAD
CNC precision threading to provide accurate leak-proof connections.

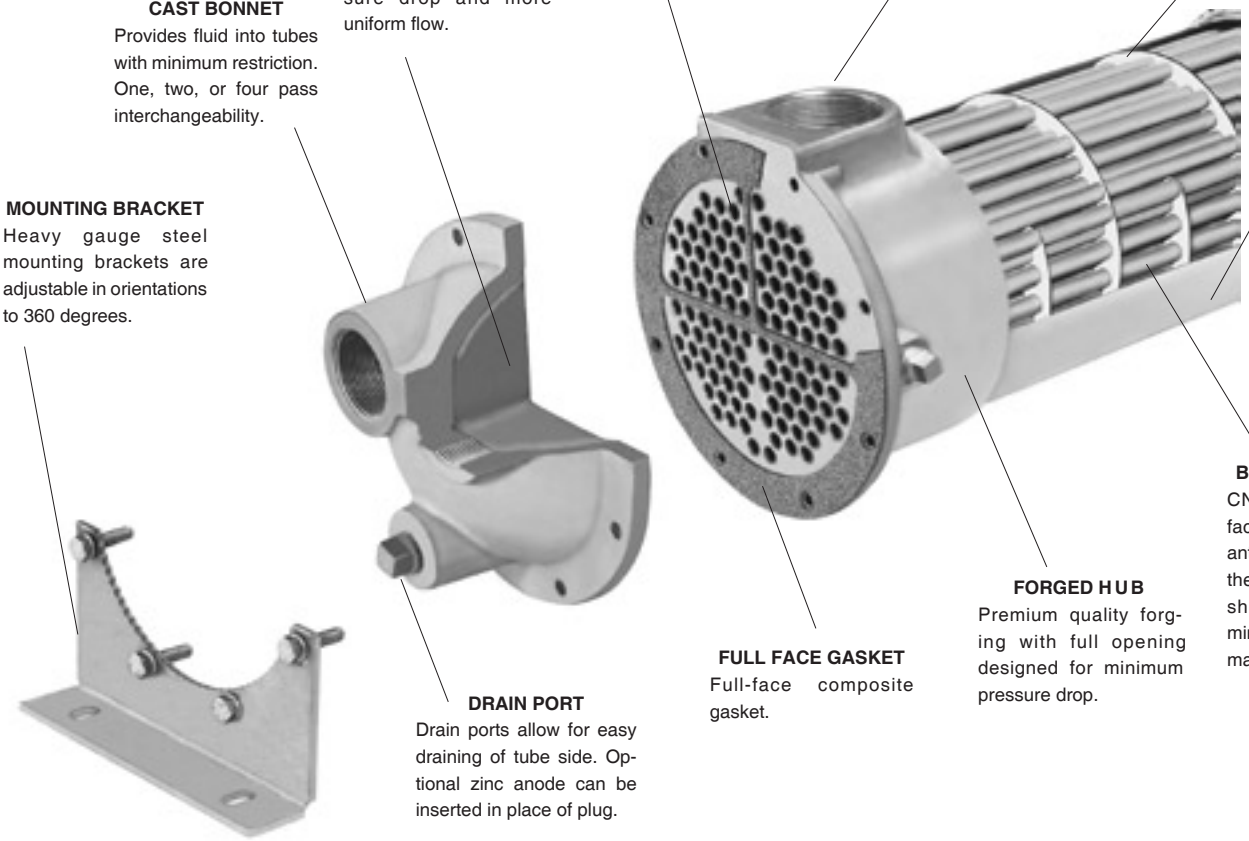
BAFFLES
CNC manufactured baffles to provide maximum turbulence and heat transfer with a minimum fluid pressure drop.

FLOW CAVITY
Generously sized to allow for minimum pressure drop and more uniform flow.

CAST BONNET
Provides fluid into tubes with minimum restriction. One, two, or four pass interchangeability.

FINISH
Gray semigloss enamel. Can be used as a base for additional coats.

MOUNTING BRACKET
Heavy gauge steel mounting brackets are adjustable in orientations to 360 degrees.



BUNDLE ASSEMBLY
CNC precision manufactured parts to guarantee a close fit between the baffles, tubes, and shell. Clearances are minimized to provide for maximum heat transfer.

FORGED HUB
Premium quality forging with full opening designed for minimum pressure drop.

FULL FACE GASKET
Full-face composite gasket.

DRAIN PORT
Drain ports allow for easy draining of tube side. Optional zinc anode can be inserted in place of plug.

UNIT CODING

AB, SAE, STS, & EAB Series *selection*

STEP 1: Calculate the heat load

The heat load in BTU/HR or (Q) can be derived by using several methods. To simplify things, we will consider general specifications for hydraulic system oils and other fluids that are commonly used with shell & tube heat exchangers.

Terms

GPM = Gallons Per Minute
CN = Constant Number for a given fluid
△T = Temperature differential across the potential
PSI = Pounds per Square Inch (pressure) of the operating side of the system
MHP = Horsepower of the electric motor driving the hydraulic pump
Kw = Kilowatt (watts x 1000)
T_{in} = Hot fluid entering temperature in °F
T_{out} = Hot fluid exiting temperature in °F
t_{in} = Cold fluid temperature entering in °F
t_{out} = Cold fluid temperature exiting in °F
Q = BTU / HR

For example purposes, a hydraulic system has a 125 HP (93Kw) electric motor installed coupled to a pump that produces a flow of 80 GPM @ 2500 PSIG. The temperature differential of the oil entering the pump *vs* exiting the system is about 5.3°F. Even though our return line pressure operates below 100 psi, we must calculate the system heat load potential (Q) based upon the prime movers (pump) capability. We can use one of the following equations to accomplish this:

To derive the required heat load (Q) to be removed by the heat exchanger, apply ONE of the following. Note: The calculated heat loads may differ slightly from one formula to the next. This is due to assumptions made when estimating heat removal requirements. The factor *(v)* represents the percentage of the overall input energy to be rejected by the heat exchanger. The *(v)* factor is generally about 30% for most hydraulic systems, however it can range from 20%-70% depending upon the installed system components and heat being generated (ie. servo valves, proportional valves, etc…will increase the percentage required).

Formula	Example
A) Q = GPM x CN x actual △T	A) Q =80 x 210 x 5.3°F = 89,040 BTU/HR
B) Q = [(PSI x GPM) / 1714] x (*v*) x 2545	B) Q =[(2500x80)/1714] x .30 x 2545 = 89,090 BTU/HR
C) Q = MHP x (*v*) x 2545	C) Q =125 x .30 x 2545 = 95,347 BTU/HR
D) Q = Kw to be removed x 3415	D) Q =28 x 3415 = 95,620 BTU/HR
E) Q = HP to be removed x 2545	E) Q =37.5 x 2545 = 95,437 BTU/HR

Constant for a given fluid (CN)

1) Oil ..... CN = 210
2) Water..... CN = 500
3) 50% E. Glycol..... CN = 450

STEP 2: Calculate the Mean Temperature Difference

When calculating the MTD you will be required to choose a liquid flow rate to derive the cold side △T. If your water flow is unknown you may need to assume a number based on what is available. As a normal rule of thumb, for oil to water cooling a 2:1 oil to water ratio is used. For applications of water to water or 50 % Ethylene Glycol to water, a 1:1 ratio is common.

Formula

$$\textbf{HOT FLUID Oil } \triangle T = \frac{Q}{CN \times GPM}$$

$$\textbf{COLD FLUID Water } \triangle t = \frac{BTU / hr}{CN \times GPM}$$

Example

$$\triangle T = \frac{89{,}090\ BTU/hr}{210\ CN \times 80GPM} \text{ (from step 1,example B)} = 5.3°F = \triangle T \text{ Rejected}$$

$$\triangle t = \frac{89{,}090\ BTU/hr}{500\ CN \times 40GPM \text{ (for a 2:1 ratio)}} = 4.5°F = \triangle t \text{ Absorbed}$$

T_{in} = Hot Fluid entering temperature in degrees F
T_{out} = Hot Fluid exiting temperature in degrees F
t_{in} = Cold Fluid entering temperature in degrees F
t_{out} = Cold Fluid exiting temperature in degrees F

$T_{in} = 125.3$ °F
$T_{out} = 120.0$ °F
$t_{in} = 70.0$ °F
$t_{out} = 74.5$ °F

$$\frac{T_{out} - t_{in}}{T_{in} - t_{out}} = \frac{S\text{[smaller temperature difference]}}{L\text{ [larger temperature difference]}} = \left(\frac{S}{L}\right)$$

$$\frac{120.0°F - 70.0°F = 50.0°F}{125.3°F - 74.5°F = 50.8°F} = \frac{50.0°F}{50.8°F} = .984$$

STEP 3: Calculate Log Mean Temperature Difference (LMTD)

To calculate the LMTD please use the following method;

L = Larger temperature difference from step 2.
M = S/L number (LOCATED IN TABLE A).

$LMTD_i = L \times M$

$LMTD_i = 50.8 \times .992$ (FROM TABLE A) = 50.39

To correct the $LMTD_i$ for a multipass heat exchangers calculate **R** & **K** as follows:

Formula

$$R = \frac{T_{in} - T_{out}}{t_{out} - t_{in}}$$

$$K = \frac{t_{out} - t_{in}}{T_{in} - t_{in}}$$

Example

$$R = \frac{125.3°F - 120°F}{74.5°F - 70°F} = \frac{5.3°F}{4.5°F} = \textbf{\{1.17=R\}}$$

$$K = \frac{74.5°F - 70°F}{124.5°F - 70°F} = \frac{4.5°F}{55.4°F} = \textbf{\{0.081=K\}}$$

Locate the correction factor CF_B (FROM TABLE B)
$LMTD_c = LMTD_i \times CF_B$
$LMTD_c = 50.39 \times 1 =$ **50.39**

Copyright © 2004 American Industrial Heat Transfer, Inc.
3905 Route 173 Zion, IL 60099 tel: 1 (847) 731-1000 fax: 1 (847) 731-1010 www.aihti.com

STEP 4: Calculate the area required

Required Area sq.ft. = $\frac{\text{Q (BTU / HR)}}{\text{LMTD}_c \text{ x U (FROM TABLE C)}}$ $\frac{89{,}090}{50.39 \text{ x } 100}$ = **17.68 sq.ft.**

STEP 5: Selection

a) From TABLE E choose the correct series size, baffle spacing, and number of passes that best fits your flow rates for both shell and tube side. Note that the tables suggest minimum and maximum information. Try to stay within the 20-80 percent range of the indicated numbers.

Example

Oil Flow Rate = 80 GPM = Series Required from Table E = **1200 Series**
Baffle Spacing from Table E = **C baffle**
Water Flow Rate = 40 GPM = Passes required in 1200 series = **4 (FP)**

b) From TABLE D choose the heat exchanger model size based upon the sq.ft. or surface area in the series size that will accommodate your flow rate.

Example

Required Area = 17.68sq.ft Closest model required based upon sq.ft. & series= **AB-1202-C6-FP**

If you require a computer generated data sheet for the application, or if the information that you are trying to apply does not match the corresponding information, please contact our engineering services department for further assistance.

AB, SAE, STS, & EAB Series *performance*

Instructions

The selection chart provided contains an array of popular sizes for quick sizing. It does not provide curves for all models available. Refer to page 4 & 5 for detailed calculation information.

Computer selection data sheets for standard or special models are available through the engineering department of American Industrial. To use the followings graphs correctly, refer to the instruction notes "1-5".

1) HP Curves are based upon a 40°F approach temperature; for example: oil leaving a cooler at 125°F, using 85°F cooling water (125°F – 85°F = 40°F).

2) The oil to water ratio of 1:1 or 2:1 means that for every 1 gallon of oil circulated, a minimum of 1 or 1/2 gallon (respectively) of 85°F water must be circulated to match the curve results.

3) OIL PRESSURE DROP CODING: ✙ = 5 psi; ☆= 10 psi; ❍ = 20 psi; △ = 50psi. Curves that have no pressure drop code symbols indicate that the oil pressure drop is less than 5 psi for the flow rate shown.

4) Pressure Drop is based upon oil with an average viscosity of 100 SSU. If the average oil viscosity is other than 100 SSU, then multiply the indicated Pressure Drop by the corresponding value from corrections table A.

5) Corrections for approach temperature and oil viscosity are as follows:

$$H.P.\left(\tfrac{\text{Removed}}{\text{In Cooler}}\right) = H.P.\left(\tfrac{\text{Actual}}{\text{Heat Load}}\right) \times \left(\frac{40}{\text{Actual Approach}}\right) \times B.$$

HEAT ENERGY DISSIPATION RATES (Basic Stock Model)

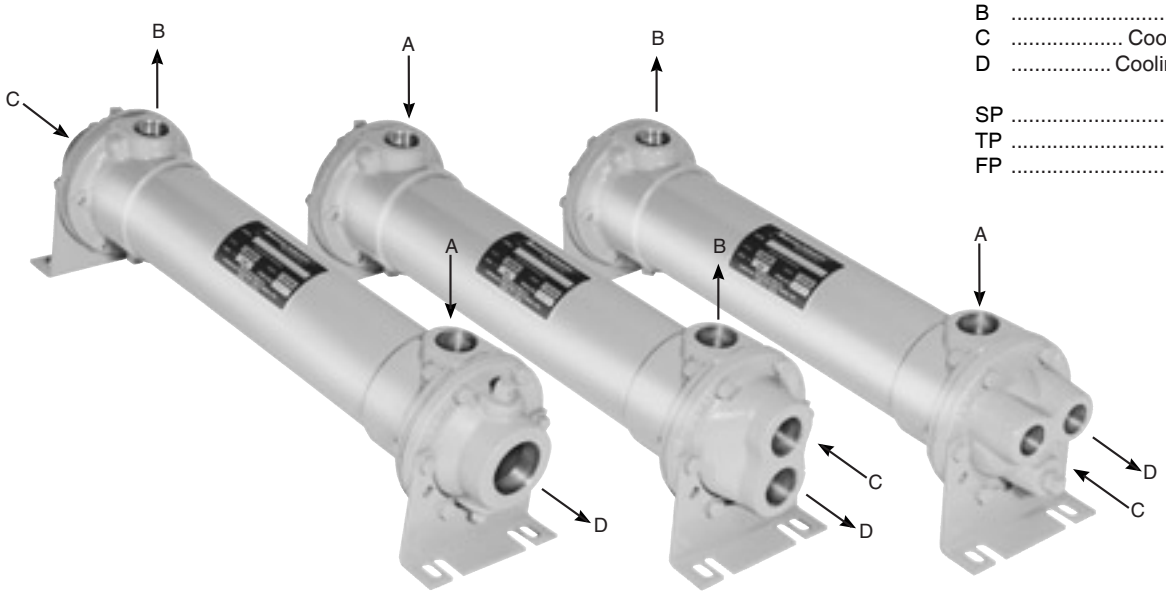
FP .....Four Pass



SINGLE PASS **TWO PASS** **FOUR PASS**

Receiving / Installation

a) Inspect unit for any shipping damage before uncrating. Indicate all damages to the trucking firms' delivery person, and mark it on the receiving bill before accepting the freight. Make sure that there is no visible damage to the outside surface of the heat exchanger. The published weight information located in this brochure is approximate. True shipment weights are determined at the time of shipping and may vary. Approximate weight information published herein is for engineering approximation purposes and should not be used for exact shipping weight. Since the warranty is based upon the unit date code located on the model identification tags, removal or manipulation of the identification tags will void the manufacturers warranty.

b) When handling the shell & tube heat exchanger, special care should be taken to avoid dropping the unit since mishandling could cause the heat exchanger to crack and leak externally. Mishandling of the unit is not covered under the manufacturers warranty. All units are shipped with partial wood/corrugated cardboard containers for safe handling.

c) Storage: American Industrial heat exchangers are protected against the elements during shipment. If the heat exchanger cannot be installed and put into operation immediately upon receipt, certain precautions are required to prevent deterioration during storage. The responsibility for integrity of the heat exchanger(s) is assumed by the user. American Industrial will not be responsible for damage, corrosion, or other deterioration of the heat exchanger during transit or storage.
Proper storage practices are important when considering the high costs of repair or replacement, and the possible delays for items which require long lead times for manufacture. The following listed practices are provided solely as a convenience to the user, who shall make their own decision on whether to use all or any of them.

1) Heat exchangers not to be placed in immediate service, require precautionary measures to prevent corrosion or contamination.
2) Heat exchangers made of ferrous materials, may be pressure-tested using compressed air at the factory. Residual oil coating on the inside surfaces of the heat exchanger(s) as a result of flushing does not discount the possibility of internal corrosion. Upon receipt, fill the heat exchanger(s) with the appropriate grade of oil or apply a corrosion preventing inhibitor for storage.
3) Corrosion protection compounds for interior surfaces for long term storage or other applications are applied solely at the request of customers. Upon request, American Industrial can provide a customer approved corrosion preventative if available when included in the original purchase order specifications.
4) Remove all dirt, water, ice, or snow and wipe dry before moving heat exchanger(s) into storage. Heat exchangers are generally shipped empty, open drain plugs to remove any accumulated condensation moisture, then reseal. Accumulation of moisture usually indicates corrosion has already started and remedial action should be taken.
5) Store in a covered, environmentally stable area. The ideal storage environment for heat exchangers is in a dry, low-humidity atmosphere which is sealed to prevent the entry of blowing dust, rain, or snow. Maintain in atmospheric temperatures between 70°F and 105°F (Large temperature swings may cause condensation and moisture to form on steel components, threads, shell, etc...) Use thermometers and humidity indicators and maintain the atmosphere at 40% relative humidity, or lower.

d) Standard Enamel Coating: American Industrial provides its standard products with a normal base coat of oil base air cure enamel paint. The enamel paint is applied as a temporary protective and esthetic coating prior to shipment. While the standard enamel coating is durable, American Industrial does not warranty it as a long-term finish coating. It is strongly suggested that a more durable final coating be applied after installation or prior to long-term storage in a corrosive environment to cover any accidental scratches, enhance esthetics, and further prevent corrosion. It is the responsibility of the customer to provide regular maintenance against chips, scratches, etc... and regular touch up maintenance must be provided for long-term benefits and corrosion prevention.

e) Special Coatings: American Industrial offers as customer options, Air-Dry Epoxy, and Heresite (Air-Dry Phenolic) coatings at additional cost. American Industrial offers special coatings upon request, however American Industrial does not warranty coatings to be a permanent solution for any equipment against corrosion. It is the responsibility of the customer to provide regular maintenance against chips, scratches, etc... and regular touch up maintenance must be provided for long-term benefits and corrosion prevention.

f) American Industrial recommends that the equipment supplied should be installed by qualified personnel who have solid understanding of system design, pressure and temperature ratings, and piping assembly. Verify the service conditions of the system prior to applying any shell & tube heat exchanger. If the system pressure or temperature does not fall within the parameters on model rating tag located on the heat exchanger, contact our factory prior to installation or operation.

g) Plan the installation to meet the requirements indicated on the piping installation diagram as illustrated above. It is recommended to put the hot fluid to be cooled through the shell side and the cold fluid through the tube side. The indicated port assembly sequence in the diagram maximizes the performance, and minimizes the possibility of thermal shock.

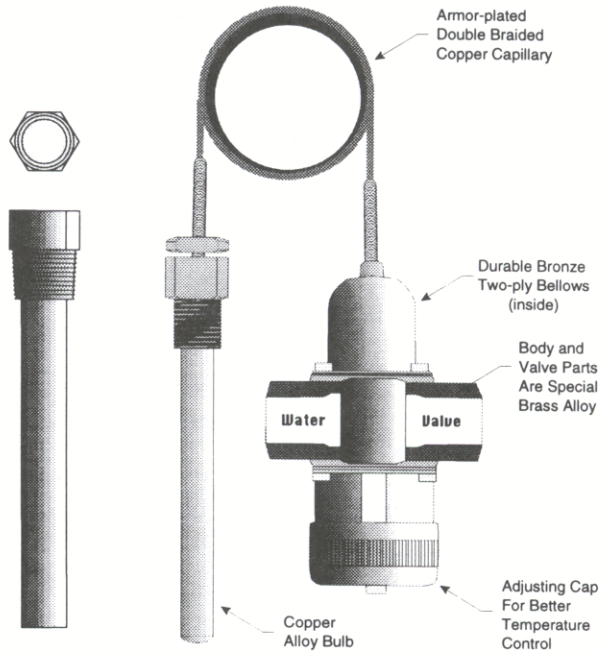
THERMOSTATIC MODULATING WATER VALVE WITH BULB WELL ASSEMBLY (for Shell & Tube Heat Exchangers And Air/Oil Coolers)

SPECIFICATIONS

Sizes	0.375", 0.50", 0.75", 1.00", 1.25" FPT
Fluid Pressure	125psi (max.)
Standard temperature	40° - 100° F., 60° - 140° F., 100° - 175° F., 125° - 200° F., 140° - 240° F., 200° - 275°F.
Body	Brass alloy casting
Valve parts	Brass alloy
Standard capillary length	6 foot, but for other sizes contact factory
Standard Bulbs	For 3/8" & 1/2" valve sizes: 5/8" x 6 with 3/4" union connections. For 3/4" & 1" valve sizes: 5/8" x 8-1/4" with 3/4" union connections.
Special Bulbs	Valve sizes: 9/16" (3-1/4" with 1/2" union connections; 9/16" x 6-3/4" with 1/2" union connection. Stainless steel construction available.
Standard bulb mounting	3/4" NPT
Seat disk	Buna-N-replaceable
Seat bead	Stainless Steel - replaceable



APPLICATION INFORMATION

- Built for rugged machine tool and hydraulic applications.
- Six temperature ranges to meet your requirements.
- Quick response to temperature changes.
- Extra heavy-duty direct acting bellows for longer service.

Note: Please consult factory if a non-cataloged temperature is required.

The type 56-T valve gives smooth regulation of water and other fluids. It's designed for the most rugged applications, for example: hydraulic power packaging equipment, hydraulic presses, plastic molding equipment, and anywhere reliability in temperature control is demanded.
The type 56-t valve is a better designed product that won't leak or chatter. To insure dependability, every valve is factory tested three times in different temperature baths. Extra performance can be expected of the bellows also. They are direct acting with sturdy walls, and the inner spring is zinc coated. The seat beads are stainless steel to resist the erosive effects of *wire drawing* and provide longer life for your needs. Additional features include mounting in any position, Buna-N seat disc, and manual flushing.

ADJUSTMENT & SERVICING

To decrease flow or raise temperature (reduce water consumption) turn adjusting cup clockwise. After making adjustment give the regulator time to adjust itself against temperature change. To remove adjusting cup remove retainer ring.

The Type 56-T valve may be flushed manually after installation to remove dirt and grit from the line. To flush valve, place a sturdy screwdriver on top of the push plate and spring assembly. (An opening in the lower housing provides ample room to insert a screwdriver). Then, compress and release the spring assembly several times.

APPLICATIONS & SPECS. ("Y" Strainers)

These strainers are engineered for water or steam, and are adaptable for many other uses. Cleaning is accomplished by simply removing a pipe plug without disconnecting any piping. Or if it is desirable to clean without interrupting service, a blow-off valve can be connected to the clean-out opening. ***Note:*** Pumps, control valves, traps, or other equipment controlling the flow of liquids or gases require proper protection with strainers for trouble free operation.

18 - Y BRASS STRAINERS

The 18 - Y strainer body is a sturdy red brass casting. Standard units have 50 mesh brass wire screens. Brazing connections available on special order instead of pipe threads.

20 - Y STRAINERS

The 20 - Y strainer has a heavy cast iron body, with accurately machined pipe thread inlet and outlet (National Pipe Thread N.P.T.). It contains a strainer screen of 0.02" thick brass with 100, 1/16" perforations per inch.

Parker FluidConnectors

Quick Coupling Division
8145 Lewis Road • Minneapolis, MN 55427
www.parker.com/quickcouplings

Applications

Parker offers a complete line of dust plugs and caps for their hydraulic quick couplings. Each series shown in this catalog has a dust plug and cap specifically designed to be used with that style of coupling.

Dust plugs and caps serve a twofold function. They keep the mating surface clean and free of contamination and protect the critical mating elements of the coupling halves when they are disconnected. In this way the nipple is protected from damage that would make the total coupling unusable.

Protective dust plugs and caps play a crucial role in the use of quick couplings and no purchase of a hydraulic quick coupling is complete without the selection of an appropriate dust plug and cap. When ordering the dust cap/plug body size must correspond to that of the coupler or nipple.

Parker's full line of dust plugs and caps can be found below and on the following pages.

Dust Plug: Used on Coupler (female half)

Dust Cap: Used on Nipple (male half)

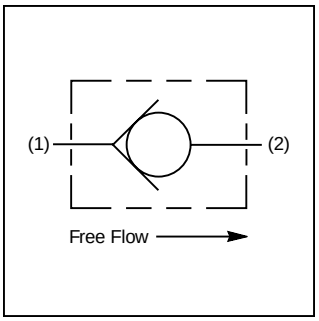
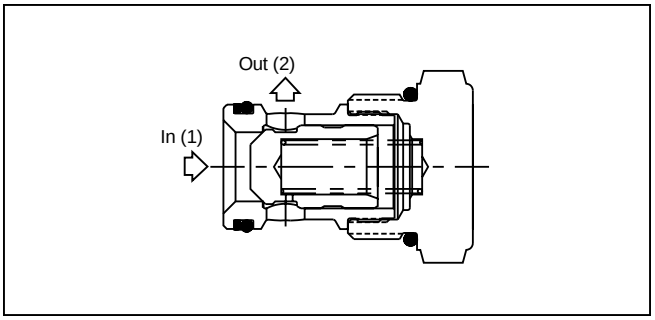
General Description

The CVH161P Series, Poppet-Type, Check Valves allow free flow in one direction while preventing flow in the reverse direction. They can be used to isolate portions of a hydraulic circuit or to provide a free flow path around a restrictive valve.





Operation

Pressure on the inlet of the check creates a force against the poppet, pushing it off its seat and permitting free flow. Reverse flow through the check is blocked by the poppet.

Features

- Hardened, precision ground parts for durability
- Compact size for reduced space requirements
- Low leakage design
- Fully guided poppet for smooth operation

Specifications

Maximum Flow	225 LPM (60 GPM)
Maximum Inlet Pressure	345 Bar (5000 PSI)
Leakage	5 drops/min. (1/3 cc/min.) at 210 Bar (3000 PSI)
Operating Temp. Range (Ambient)	-40°C to +93.3°C (Nitrile) (-40°F to +200°F) -31.7°C to +121.1°C (Fluorocarbon) (-25°F to +250°F)
Cartridge Material	All parts steel. All operating parts hardened steel.
Body Material	Steel or Aluminum
Filtration	ISO code 16/13, SAE Class 4 or better
Mounting	No Restrictions
Cavity	Common Cavity No. C16-2

A16B	1″ BSPG (B16-2-A16B) Aluminum

NOTE:
If system pressure does not exceed 210 Bar (3000 PSI), aluminum bodies can be used. Higher pressures require steel bodies.

SERVICE PARTS
Nitrile Seal Kit: SK16-2
Fluorocarbon Seal Kit: SK16-2V

Shipping Weight
Cartridge Only .27 kg (0.6 lbs.)
Cartridge in Body 1.8 kg (4.0 lbs.)

Features

- Knurled sleeve allows simple twist-to-connect operation without the use of tools
- Rugged design allows connect-under-pressure operation up to 5800 psi
- Maximum rated working pressure of 9000 psi exceeds the requirements of most applications
- Integral threaded dust cap protects the test point from damage and contamination
- EMA fittings are machined from solid barstock and protected with zinc plating and a dichromate finish for reliability and long life.
- Stainless steel springs for corrosion resistance
- Elastomeric interface and valve seals provide leak free operation
- Compact design and optional high pressure hose assemblies provide flexibility for tight space requirements
- EMA3/14X1.SED nipple meets the ISO15171-2 standard

Applications

EMA couplings provide easy diagnostic connections for Parker SensoControl® equipment or mechanical gages. EMA test points are typically permanently plumbed into a fluid system at locations where pressure measurements are required for maintenance or testing. Integral pressure cap protects the test point from damage and prevents contamination of the fluid system. Proven twist-to-connect design allows the test points to be connected even when the system is in operation and the test points are pressurized. EMA's compact design and optional high pressure hose assemblies allow extra flexibility for the location of system test points.

Although designed primarily for diagnostic applications, EMA fittings and hose assemblies are idea for a wide range of applications that require compact high pressure connections and limited flow rates.

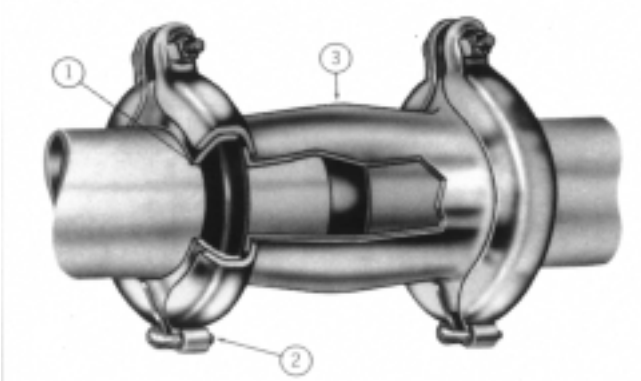
Flexmaster® Joints in Standard and Self-Restrained Configurations



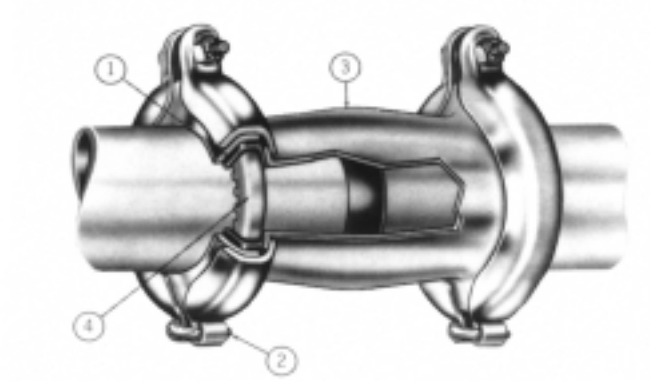
STANDARD FEATURES

① Gasket provides compression seal when tightened against tube or pipe.

② Hinged coupling provides for quick, easy assembly.

③ Bulged sleeve allows for ±4° angular misalignment.

All gasket materials listed on page 248 are available in the standard style, increasing the number of suitable applications.



SELF-RESTRAINED FEATURES

① Gasket provides compression seal when tightened against tube or pipe.

② Hinged coupling provides for quick, easy assembly.

③ Bulged sleeve allows for ±4° angular misalignment.

Plus

④ Notched channel ring which grips pipe firmly to restrict movement along pipe or tubing.

Gasket materials available include the C (Buna-N) and D (EPDM) compounds.

Flexmaster® joints are available in both standard and self-restrained styles. The self-restrained style has a stainless steel gripping ring inside each gasket. This feature allows the joint to maintain a firm grip on the pipe or tube, preventing movement along the pipe or tube.

The bulged, straight-through Flexmaster joints accommodate angular misalignment up to ±4° per end. Tees, elbows, and crosses accommodate angular misalignment up to ±2° per end. See pages 254 thru 259 for the angular misalignment allowed on each specific part. Flexmaster joints are designed for up to 300 psi (2.07 MPa) service, depending on application and size. Refer to pressure ratings on page 248.

Flexmaster joints absorb vibration and are ideal for making quick connections and disconnections when repairing or disassembling a system. They can be furnished with several types of gasket compounds and sleeve materials, including stainless steel for marine and corrosive applications.

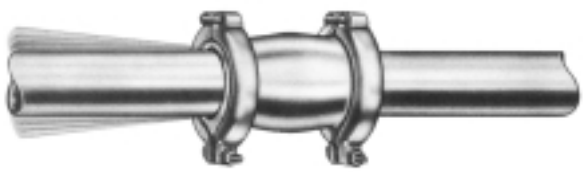
Flexmaster joints are currently in use in thousands of applications throughout the world. For typical Flexmaster joint applications see photos on page 260.

SAVE TIME – MAKE PIPE AND TUBE CONNECTION EASIER

used on plain end tube or pipe

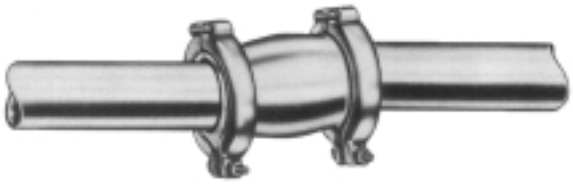
No threading, flanging, welding, grooving or other special end preparation of tube or pipe is required. Use pipe after it is cut to appropriate lengths. The Flexmaster joint will accommodate large tolerances in the length of the gap. See Table 1, page 253 for insertion depth tolerances.

absorbs vibration



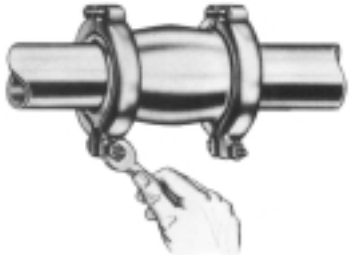
Pipe vibration and noise can be drastically reduced with Flexmaster joints. The resilient, thick rubber of the Flexmaster joint gasket absorbs vibration and noise. Use of the self-restrained style restricts movement along vibrating pipes and tubes.

even misaligned piping is no problem



The Flexmaster joint design eliminates flanged bolt holes and pipe threads that require careful alignment. The Flexmaster bulged joint permits up to a total of ±4° angular installation misalignment at each end while maintaining a leakproof seal.

easy to install



Installation time can be slashed by using Flexmaster joints. Basic assembly tools are all that's needed. After extensive use, the gaskets can be replaced easily and quickly. See page 252 for complete assembly instructions.

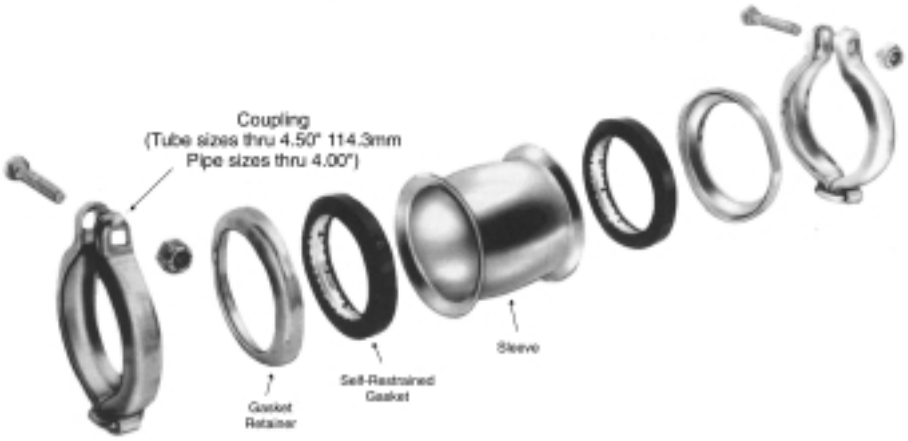
Coupling
(Tube sizes over 4.50" 114.3mm
Pipe sizes over 4.00" 101.6 mm)

Standard (Un-Restrained) Style



Self-Restrained Style

NH16XX ( ) 000 ( ) 0000

Basic Part Number (from pages 254-259)
Example: NH1600

Gasket Material:
- C = Buna-N (Standard)
- D = EDPM
- * N = BUNA-N (High Temperature)
- * S = Silicone
- * V = Fluorocarbon
- * G = Mineral Fiber (EXHAUST APPLICATIONS NOT SUBJECT TO FLEXING)

* Available in Standard (Un-Restrained) Model Only.

Example Part Number: NH1600C075B0250
Complete assemblies may be ordered by the procedure shown above. Standard components may be ordered as shown on page 251.

Size of Pipe or Tube to be connected: (in hundredths of inch)
Example: .75" = 075

Sleeve Material:
B = Plated Steel (Standard)
S = Stainless Steel (Sleeve only – consult Eaton Aeroquip for availability)

Joint Length (in thousands of inch).
Example: 2.5" = 0250
Style is available in lengths shown. Other lengths are available in multiples of 1-inch on special requests. Contact Eaton Aeroquip for availability.

Pipe and tubing preparation and Flexmaster® joint installation instructions

1. Pipe (Tube) End Preparation
- a) Deburr and clean pipe (tube) ends.
- b) Surface should be free of deep scratches, gouges, dents, dirt, etc.

2. Joint Installation
- a) Install retainer (1), gasket* (2) and sleeve (3) on one side of pipe in sequence shown in Figure 1.
- b) Install remaining retainer (4) and gasket (5) on other pipe end.
- c) Position retainer (4) and gasket (5) to proper pipe insertion depth (“D”) as shown in Table 1.

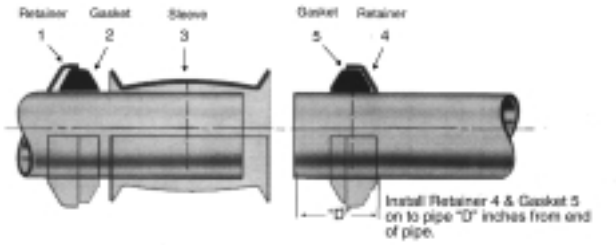


Figure 1

- d) Slide sleeve (3) to gasket (5) and move gasket (2) and retainer (1) into position as shown in Figure 2. Pipe must be inserted to proper depth (“D”) into both gaskets as shown in Table 1.

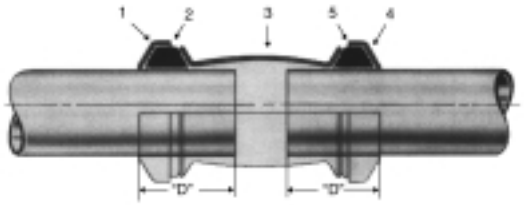

Figure 2

***3.** Special Notes
- a) Assembly of gaskets can be made easier by dipping gaskets in water or the fluid to be sealed. The use of other rubber lubricants can be detrimental to the life of the gaskets. Never lubricate the metal parts.
- b) Self-restrained gasket installation. To simplify installation of a self-restrained gasket, install lower gasket halfway onto the pipe first, leaving the split area in the steel retaining ring free at the top. See Figure 3. Then, stretch the gasket and split area of the retaining ring until they slip
over the tube or pipe and into position. Refer to Figure 3.

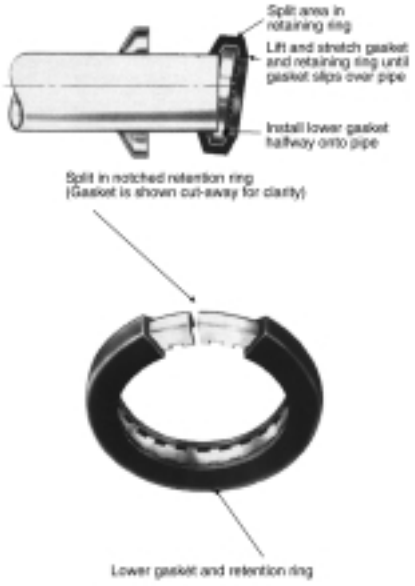

Figure 3

4. Coupler Installation
Install both V-couplings, encompassing the retainer, gasket and sleeve as shown in Figure 4. Do not tighten either coupling until the entire joint is assembled (See Figure 2). Tighten nuts to the torque specified in Table 2. Do not lubricate the nut or bolt before assembly. The gap method outlined in Table 3 may be used for standard gaskets only.

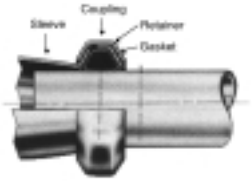

Figure 4

WARNING

Maximum temperature ratings are meant as a guide only. For extreme temperature conditions, consult factory.

Improper installation, use or selection of the Flexmaster joint can result in personal injury, property damage or death.

This page is part of a complete catalog which contains technical and safety data that must be reviewed when selecting a product.

NOTE: Letter X in part numbers shown indicates a code letter to be filled in. See page 250 for explanation of part numbers and how to order.
**Black part numbers are standard type. Gray part numbers are self-restrained type.*
***Sleeve in this size is cylindrical (no-bulge). Allowable misalignment is ±2° per end for this size.*

This page is part of a complete catalog which contains technical and safety data that must be reviewed when selecting a product.

General Description

Series “C” check valves permit free flow in one direction, and dependable shut-off in the reverse direction.

Operation

When pressure going throught the valve is increased to the cracking level the valve opens. When the pressure is reduced to below the cracking level the valve closes.

Features

- Stainless steel poppets standard.
- Soft seal poppets are available.
- Triangular retainers guide the poppets, and hold the spring firmly in place even under high velocity and shock.

Specifications

Maximum Operating Pressure	Brass: 140 Bar (2000 PSI); except for C1600 brass which is 35 Bar (500 PSI) Steel: 345 Bar (5000 PSI) for 200 thru 1220; 207 Bar (3000 PSI) for all other sizes and styles

836E Pressure Switches

Features

- Microprocessor based with no moving parts for longer life and reduced downtime
- Rugged, corrosion-resistant 316L stainless steel housing features an IP66 enclosure rating to withstand harsh industrial conditions
- Operating pressures from –15…6000 psi (gauge)
- Industry-leading four-digit 14-segment digital display
- Independently programmable dual PNP NO/NC outputs or 4…20 mA analog output with single PNP NO/NC output
- Stainless steel sensing element

Applications

- Automotive industry
- Machine tool
- Injection molding machines
- Hydraulics
- Pneumatics
- Food and beverage
- Pharmaceuticals

Specifications

Certifications	cULus, CE Marked for all applicable directives, and 3 A authorized only with sanitary adaptor
Supply Voltage	12…30V DC
Output	Dual PNP N.O./N.C. or 4…20 mA analog with single PNP N.O./N.C.
Supply Current	<60 mA (no load)
Load Current, Max.	250 mA (per PNP output)
Analog Output Impedance	Max (Vsupply - 6.5V)/0.22 A
Accuracy	<0.5% of upper pressure range limit Analog Nonlinearity: <0.2% (as per limit point method)
Repeatability	<0.2% of upper pressure range limit
Long Term Drift	<0.15% per year
Media Temperature [C (F)]	-40…100° (-40…212°)
Operating Temperature [C (F)]	-40…85° (-40…185°)
Housing Material	316L stainless steel
Wetted Parts	316L stainless steel
Enclosure Type Rating	IP66 ❶
Switch Cycles, Min.	>10,000,000
Over Pressure Limit (psi) ❷	1.5 times MWP
Burst Pressure Limit	3 times MWP
Response Time	Switch Output: ≤20 ms; Analog Output: Rise Time: T_{90} ≤200 ms; Analog Output: Settling Time: T_{99} ≤500 ms

❶ Pressure sensors up to 60 psi are rated IP60.

❷ Maximum working pressure (MWP) is the maximum pressure that switches can tolerate for an indefinite period of time. Over pressure limit is the maximum pressure that switches can tolerate for a short period of time without sustaining permanent damage. Burst pressure limit is the maximum pressure that switches can tolerate without sustaining permanent damage or leakage.

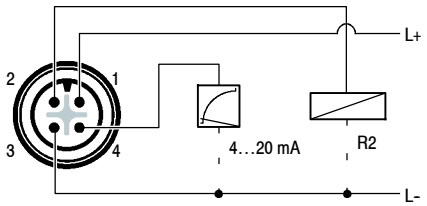
Dual PNP



4…20 mA Analog with Single PNP

Note: Output 2 operates as diagnostic/break contact in DESINA mode.

❶ 145.2 (5.71) for 6000psi switch.

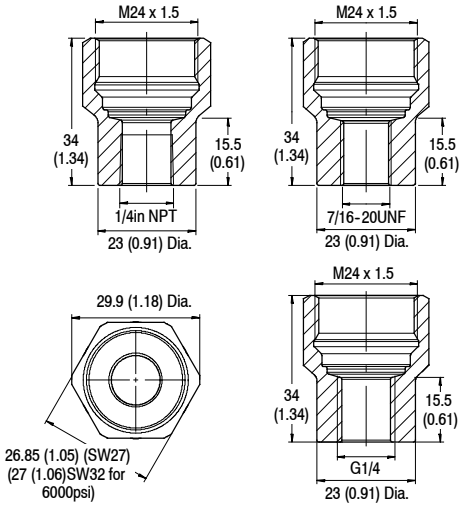
Accessories

Description	Cat. No.
Configuation kit (includes converter cable and ReadWin 2000 software)	836E-NSR
1/4 in. NPT (female) adaptor	836E-NP71
7/16-20 UNF (female) adaptor	836E-NP72
G1/4 BSPP (female) adaptor	836E-NP73
1/4 in. NPT (male) adaptor	836E-NP74

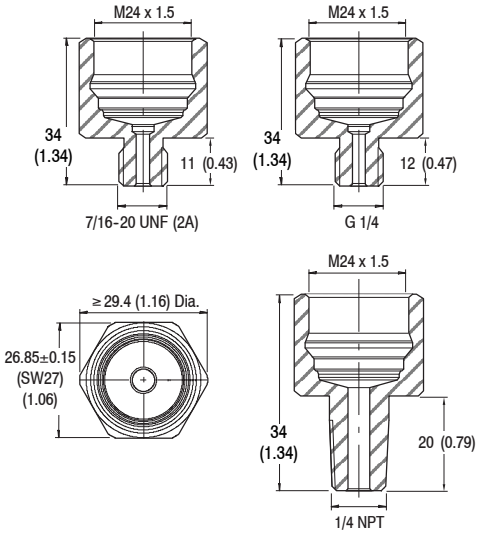
Description	Cat. No.
7/16-20 UNF (male) adaptor	836E-NP75
G1/4 BSPP (male) adaptor	836E-NP76
1…1.5 inch sanitary clamp	836E-NH7B
2 inch sanitary clamp	836E-NH7C
O-ring (EPDM)	836E-NV1
O-ring (fluorinated elastomer seal)	836E-NV2

Note: Maximum female adaptor pressure range = 1,450psi (100 bar).
Maximum male adaptor pressure range = 580psi (40 bar).

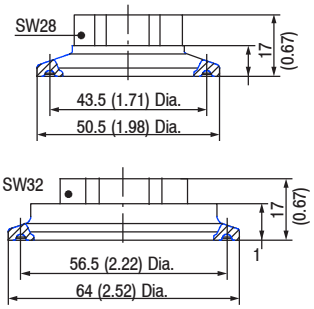
Female Adaptors



Male Adaptors



Sanitary Connectors



836E Nondisplay Pressure Switches

Features

- Microprocessor based with no moving parts for longer life and reduced downtime
- Rugged, corrosion-resistant 304 stainless steel housing features an IP65 enclosure rating to withstand harsh industrial conditions
- Operating pressures from 0...6000 psi (gauge)
- 4...20 mA analog output
- 316L stainless steel sensing element

Applications

- Automotive industry
- Machine tool
- Injection molding machines
- Hydraulics
- Pneumatics

Specifications

Certifications	CE Marked for all applicable directives
Supply Voltage	12…30V DC
Output	4…20 mA analog
Supply Current	<30 mA
Analog Output Impedance	Max. (Vsupply - 12V)/0.02 A
Accuracy	<0.5% of upper pressure range limit analog nonlinearity
Repeatability	< 0.2% of upper pressure range limit
Long Term Drift	<0.15% per year
Media Temperature [C (F)]	-25…70° (-13…158°)
Operating Temperature [C (F)]	-25…70° (-13…158°) [ambient]
Storage Temperature [C (F)]	-40…85° (-40…185°)
Housing Material	304 stainless steel
Sensor Diaphragm	316L stainless steel
Enclosure Type Rating	IP65/NEMA 4
Over Pressure Limit (psi) ❶	1.5 times MWP
Response Time	2…5 ms

❶ Maximum working pressure (MWP) is the maximum pressure that switches can tolerate for an indefinite period of time. Over pressure limit is the maximum pressure that switches can tolerate for a short period of time without permanent damage.

Rosemount 3051 Pressure Transmitter

THE PROVEN INDUSTRY LEADER IN PRESSURE MEASUREMENT

- *Best-in-Class performance with 0.04% High Accuracy option*
- *Industry first installed five-year stability*
- *Unmatched Dynamic Performance*
- *Coplanar™ platform enables integrated pressure, flow, and level solutions*
- *Advanced PlantWeb® Functionality to increase plant productivity*

Setting the Standard for Pressure Measurement

Proven best-in-class performance, reliability and safety

- Over 4 million installed
- Meet your application needs with extensive offering
- Real world total performance of ±0.15%
- Reference accuracy of ±0.04%

Flow

Pressure

Maximize Installation Flexibility with Coplanar Platform

- Improve reliability and performance with integrated DP Flowmeters, DP Level and manifolds
- Easy installation with all solutions fully assembled, leak-tested and calibrated
- Meet your application needs with an unsurpassed offering

Level

Unlock the Value of Devices with the Smart Wireless THUM™ Adapter

- Gain access to field intelligence and improve quality, safety, availability, operations and maintenance costs
- Remotely manage devices and monitor health
- Enable new wireless measurement points
- Utilize existing loop power

Innovative, Integrated DP Flowmeters

- Fully assembled and leak tested for out-of-the-box installation
- Reduce straight pipe requirements, lower permanent pressure loss and achieve accurate measurement in small line sizes
- Up to 1.65% volumetric flow accuracy at 8:1 turndown

Proven, Reliable and Innovative DP Level Technologies

- Connect to virtually any process with a comprehensive offering of process connections, fill fluids, direct mount or capillary connections and materials
- Quantify and optimize total system performance with QZ option
- Operate at higher temperature and in vacuum applications
- Optimize level measurement with cost efficient Tuned-System™ Assemblies

Instrument Manifolds – Quality, Convenient, and Easy

- Design and engineered for optimal performance with Rosemount transmitters
- Save installation time and money with factory assembly
- Offers a variety of styles, materials and configurations

Rosemount 3051T Gage and Absolute Pressure Transmitter

3051T Gage and Absolute Pressure Transmitter

Rosemount 3051T Inline Pressure transmitters provide reliable Gage and Absolute pressure measurement in a compact inline design. Select from the following capabilities for seamless integration:

- Performance up to 0.04% accuracy
- Manifolds and Seal Solutions
- 4-20 mA HART, FOUNDATION fieldbus, and Profibus PA protocols
- Calibrated spans/ranges from 0.3 to 10,000 psi (10,3 mbar to 689 bar)
- 316 SST and Alloy C-276 process isolators

(1) 3051TG lower range limit varies with atmospheric pressure.

(2) Option code M4 - LCD Display with Local Operator Interface required for local addressing and configuration.

(3) Materials of Construction comply with recommendations per NACE MR0175/ISO 15156 for sour oil field production environments. Environmental limits apply to certain materials. Consult latest standard for details. Selected materials also conform to NACE MR0103 for sour refining environments.

(4) "Assemble-to" items are specified separately and require a completed model number.

(5) Not available with low-power Option Code M.

(6) Not available with fieldbus (output code F) or Profibus protocols (output code W).

(7) Local zero and span adjustments are standard unless Option Code J1 or J3 is specified.

(8) Available only with output code W - Profibus PA.

(9) NAMUR-Compliant operation is pre-set at the factory and cannot be changed to standard operation in the field.

(10) The V5 option is not needed with T1 option; external ground screw assembly is included with the T1 option.

Specifications

PERFORMANCE SPECIFICATIONS

This product data sheet covers both HART, FOUNDATION fieldbus and Profibus PA protocols unless specified.
For zero-based spans, reference conditions, silicone oil fill, glass-filled PTFE o-rings, SST materials, Coplanar flange (3051C) or $^1/_2$ in.- 14 NPT (3051T) process connections, digital trim values set to equal range points.

Conformance To Specification (±3σ (Sigma))

Technology leadership, advanced manufacturing techniques and statistical process control ensure specification conformance to at least ±3σ.

Reference Accuracy

Stated reference accuracy equations include terminal based linearity, hysteresis, and repeatability.
For FOUNDATION fieldbus and Profibus PA devices, use calibrated range in place of span.

Models	Standard	High Accuracy Option
3051CD, 3051CG Range 0 (CD)	±0.10% of span For spans less than 2:1, accuracy = ±0.05% of URL	
Range 1	±0.10% of span For spans less than 15:1, accuracy = $\pm\left[0.025 + 0.005\left(\frac{URL}{Span}\right)\right]$% of Span	
Ranges 2-5	±0.065% of span For spans less than 10:1, accuracy = $\pm\left[0.015 + 0.005\left(\frac{URL}{Span}\right)\right]$% of Span	Ranges 2-4 High Accuracy Option, P8 ±0.04% of span For spans less than 5:1, accuracy = $\pm\left[0.015 + 0.005\left(\frac{URL}{Span}\right)\right]$% of Span
3051T Ranges 1-4	±0.065% of span For spans less than 10:1, accuracy = $\pm\left[0.0075\left(\frac{URL}{Span}\right)\right]$% of Span	Ranges 2-4 High Accuracy Option, P8 ±0.04% of span For spans less than 5:1, accuracy = $\pm\left[0.0075\left(\frac{URL}{Span}\right)\right]$% of Span
Range 5	±0.075% of span For spans less than 10:1, accuracy = $\pm\left[0.0075\left(\frac{URL}{Span}\right)\right]$% of Span	
3051CA Ranges 1-4	±0.065% of span For spans less than 10:1, accuracy = $\pm\left[0.0075\left(\frac{URL}{Span}\right)\right]$% of Span	Ranges 2-4 High Accuracy Option, P8 ±0.04% of span For spans less than 5:1, accuracy = $\pm\left[0.0075\left(\frac{URL}{Span}\right)\right]$% of Span
3051L All Ranges	±0.075% of span For spans less than 10:1, accuracy = $\pm\left[0.025 + 0.005\left(\frac{URL}{Span}\right)\right]$% of Span

(1) For smaller line sizes, see Rosemount Compact Orifice

Total Performance

Total Performance is based on combined errors of reference accuracy, ambient temperature effect, and static pressure effect.

For ±50 °F (28 °C) temperature changes, up to 1000 psi (6,9 MPa) line pressure (CD only), from 1:1 to 5:1 rangedown.

Models	Total Performance
3051C Ranges 2-5	±0.15% of span
3051T Ranges 1-4	±0.15% of span

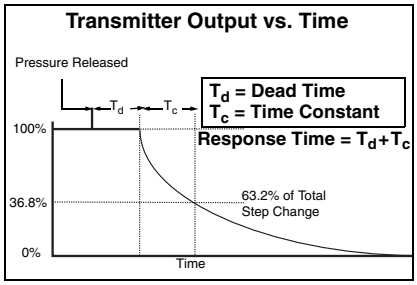
Long Term Stability

Models	Long Term Stability
3051C Ranges 2-5	±0.125% of URL for 5 years ±50 °F (28 °C) temperature changes, and up to 1000 psi (6,9 MPa) line pressure.
3051CD Low/Draft Range Ranges 0-1	±0.2% of URL for 1 year
3051T Ranges 1-4	±0.125% of URL for 5 years ±50 °F (28 °C) temperature changes, and up to 1000 psi (6,9 MPa) line pressure.

Dynamic Performance

	4 - 20 mA HART(1) 1-5 Vdc HART Low Power	FOUNDATION fieldbus and Profibus PA protocols(3)	Typical HART Transmitter Response Time
Total Response Time (T_d + T_c)(2):			
3051C, Ranges 2-5:	100 ms	152 ms	
Range 1:	255 ms	307 ms	
Range 0:	700 ms	N/A	
3051T:	100 ms	152 ms	
3051L:	See Instrument Toolkit®	See Instrument Toolkit	
Dead Time (Td)	45 ms (nominal)	97 ms	
Update Rate	22 times per second	22 times per second	

(1) Dead time and update rate apply to all models and ranges; analog output only
(2) Nominal total response time at 75 °F (24 °C) reference conditions.
(3) Transducer block response time, Analog Input block execution time not included.



Line Pressure Effect per 1000 psi (6,9 MPa)

For line pressures above 2000 psi (13,7 MPa) and Ranges 4-5, see user manual (Document number 00809-0100-4001 for HART, 00809-0100-4774 for FOUNDATION fieldbus, and 00809-0100-4797 for Profibus PA).

Models	Line Pressure Effect
3051CD, 3051CF	Zero Error(1)
Range 0	±0.125% of URL/100 psi (6,89 bar)
Range 1	±0.25% of URL/1000 psi (68,9 bar)
Ranges 2-3	±0.05% of URL/1000 psi (68,9 bar) for line pressures from 0 to 2000 psi (0 to 13,7 MPa)
	Span Error
Range 0	±0.15% of reading/100 psi (6,89 bar)
Range 1	±0.4% of reading/1000 psi (68,9 bar)
Ranges 2-3	±0.1% of reading/1000 psi (68,9 bar)

(1) Can be calibrated out at line pressure.

Ambient Temperature Effect per 50°F (28°C)

Models	Ambient Temperature Effect
3051CD, 3051CG, 3051CF	
Range 0	±(0.25% URL + 0.05% span)
Range 1	±(0.1% URL + 0.25% span)
Ranges 2-5	±(0.0125% URL + 0.0625% span) from 1:1 to 5:1 ±(0.025% URL + 0.125% span) from 5:1 to 100:1
3051T	
Range 1	±(0.025% URL + 0.125% span) from 1:1 to 10:1 ±(0.05% URL + 0.125% span) from 10:1 to 100:1
Range 2-4	±(0.025% URL + 0.125% span) from 1:1 to 30:1 ±(0.035% URL + 0.125% span) from 30:1 to 100:1
Range 5	±(0.1% URL + 0.15% span)
3051CA	
All Ranges	±(0.025% URL + 0.125% span) from 1:1 to 30:1
	±(0.035% URL + 0.125% span) from 30:1 to 100:1
3051L	See Instrument Toolkit software.

Mounting Position Effects

Models	Mounting Position Effects
3051C	Zero shifts up to ±1.25 inH_2O (3,11 mbar), which can be calibrated out. No span effect.
3051L	With liquid level diaphragm in vertical plane, zero shift of up to 1 inH_2O (2,49 mbar). With diaphragm in horizontal plane, zero shift of up to 5 inH_2O (12,43 mbar) plus extension length on extended units. All zero shifts can be calibrated out. No span effect.
3051CA, 3051T	Zero shifts up to 2.5 inH_2O (6,22 mbar), which can be calibrated out. No span effect.

Vibration Effect

Less than ±0.1% of URL when tested per the requirements of IEC60770-1 field or pipeline with high vibration level (10-60 Hz 0.21 mm displacement peak amplitude / 60-2000 Hz 3g).

Power Supply Effect

Less than ±0.005% of calibrated span per volt.

RFI Effects

±0.1% of span from 20 to 1000 MHz and for field strength up to 30 V/m.

Electromagnetic Compatibility (EMC)

Meets all relevant requirements of EN 61326 and Namur NE-21.

Transient Protection (Option Code T1)

Meets IEEE C62.41, Category Location B

6 kV crest (0.5 μs - 100 kHz)
3 kV crest (8 × 20 microseconds)
6 kV crest (1.2 × 50 microseconds)

NOTE
Calibrations at 68 °F (20 °C) per ASME Z210.1 (ANSI)

(1) Assumes atmospheric pressure of 14.7 psig.

Service

Liquid, gas, and vapor applications

4-20 mA HART (Output Code A)

Output

Two-wire 4-20 mA, user-selectable for linear or square root output. Digital process variable superimposed on 4-20 mA signal, available to any host that conforms to the *HART* protocol.

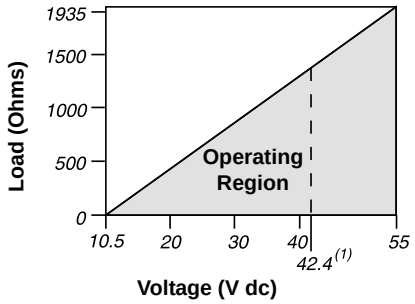
Power Supply

External power supply required. Standard transmitter (4-20 mA) operates on 10.5 to 55 V dc with no load.

Load Limitations

Maximum loop resistance is determined by the voltage level of the external power supply, as described by:

Max. Loop Resistance = 43.5 (Power Supply Voltage – 10.5)



Communication requires a minimum loop resistance of 250 ohms.

(1) For CSA approval, power supply must not exceed 42.4 V.

Zero and Span Adjustment Requirements

Zero and span values can be set anywhere within the range limits stated in Table 7 and Table 8.

Span must be greater than or equal to the minimum span stated in Table 7 and Table 8.

Indication

Optional two line LCD display

FOUNDATION fieldbus (Output code F)

Power Supply

External power supply required; transmitters operate on 9.0 to 32.0 V dc transmitter terminal voltage.

Current Draw

17.5 mA for all configurations (including LCD display option)

Indication

Optional two line LCD display

FOUNDATION fieldbus Function Block Execution Times

Block	Execution Time
Resource	-
Transducer	-
LCD Block	-
Analog Input 1, 2	30 milliseconds
PID	45 milliseconds
Input Selector	30 milliseconds
Arithmetic	35 milliseconds
Signal Characterizer	40 milliseconds
Integrator	35 milliseconds

FOUNDATION fieldbus Parameters

Schedule Entries	7 (max.)
Links	20 (max.)
Virtual Communications Relationships (VCR)	12 (max.)

Standard Function Blocks

Resource Block

Contains hardware, electronics, and diagnostic information.

Transducer Block

Contains actual sensor measurement data including the sensor diagnostics and the ability to trim the pressure sensor or recall factory defaults.

LCD Block

Configures the local display.

2 Analog Input Blocks

Processes the measurements for input into other function blocks. The output value is in engineering units or custom and contains a status indicating measurement quality.

PID Block

Contains all logic to perform PID control in the field including cascade and feedforward.

Backup Link Active Scheduler (LAS)

The transmitter can function as a Link Active Scheduler if the current link master device fails or is removed from the segment.

Advanced Control Function Block Suite (Option Code A01)

Input Selector Block

Selects between inputs and generates an output using specific selection strategies such as minimum, maximum, midpoint, average or first “good.”

Arithmetic Block

Provides pre-defined application-based equations including flow with partial density compensation, electronic remote seals, hydrostatic tank gauging, ratio control and others.

Signal Characterizer Block

Characterizes or approximates any function that defines an input/output relationship by configuring up to twenty X, Y coordinates. The block interpolates an output value for a given input value using the curve defined by the configured coordinates.

Integrator Block

Compares the integrated or accumulated value from one or two variables to pre-trip and trip limits and generates discrete output signals when the limits are reached. This block is useful for calculating total flow, total mass, or volume over time.

FOUNDATION fieldbus Diagnostics Suite (Option Code D01)

The 3051C FOUNDATION fieldbus Diagnostics provide Abnormal Situation Prevention (ASP) indication. The integral statistical process monitoring (SPM) technology calculates the mean and standard deviation of the process variable 22 times per second. The 3051C ASP algorithm uses these values and highly flexible configuration options for customization to many user-defined or application specific abnormal situations. The detection of plugged impulse lines is the first available predefined application.

Profibus PA (Output Code W)

Profile Version

3.02

Power Supply

External power supply required; transmitters operate on 9.0 to 32.0 V dc transmitter terminal voltage.

Current Draw

17.5 mA for all configurations (including LCD display option)

Output Update Rate

Four times per second

Standard Function Blocks

Analog Input (AI Block)

The AI function block processes the measurements and makes them available to the host device. The output value from the AI block is in engineering units and contains a status indicating the quality of the measurement.

Physical Block

The physical block defines the physical resources of the device including type of memory, hardware, electronics and diagnostic information.

Transducer Block

Contains actual sensor measurement data including the sensor diagnostics and the ability to trim the pressure sensor or recall factory defaults.

Indication

Optional two line LCD display

Local Operator Interface

Optional external configuration buttons

1-5 Vdc HART Low Power (Output Code M)

Output

Three wire 1-5 V dc or 0.8-3.2 V dc (Option Code C2) user-selectable output. Also user selectable for linear or square root output configuration. Digital process variable superimposed on voltage signal, available to any host conforming to the *HART* protocol. Low-power transmitter operates on 6-12 V dc with no load.

Power Consumption

3.0 mA, 18-36 mW

Minimum Load Impedance

100 kΩ (V_{out} wiring)

Indication

Optional 5-digit LCD display

Overpressure Limits

Rosemount 3051CD/CG/CF

- Range 0: 750 psi (51,7 bar)
- Range 1: 2000 psig (137,9 bar)
- Ranges 2-5: 3626 psig (250 bar)
  4500 psig (310,3 bar) for option code P9

Rosemount 3051CA

- Range 1: 750 psia (51,7 bar)
- Range 2: 1500 psia (103,4 bar)
- Range 3: 1600 psia (110,3 bar)
- Range 4: 6000 psia (413,7 bar)

Rosemount 3051TG/TA

- Range 1: 750 psi (51,7 bar)
- Range 2: 1500 psi (103,4 bar)
- Range 3: 1600 psi (110,3 bar)
- Range 4: 6000 psi (413,7 bar)
- Range 5: 15000 psi (1034,2 bar)

For 3051L or Level Flange Option Codes FA, FB, FC, FD, FP, and FQ, limit is 0 psia to the flange rating or sensor rating, whichever is lower.

Table 9. 3051L and Level Flange Rating Limits

Standard	Type	CS Rating	SST Rating
ANSI/ASME	Class 150	285 psig	275 psig
ANSI/ASME	Class 300	740 psig	720 psig
ANSI/ASME	Class 600	1480 psig	1440 psig
At 100 °F (38 °C), the rating decreases with increasing temperature, per ANSI/ASME B16.5.			
DIN	PN 10-40	40 bar	40 bar
DIN	PN 10/16	16 bar	16 bar
DIN	PN 25/40	40 bar	40 bar
At 248 °F (120 °C), the rating decreases with increasing temperature, per DIN 2401.			

Static Pressure Limit

Rosemount 3051CD Only

Operates within specifications between static line pressures of 0.5 psia and 3626 psig (4500 psig (310, 3 bar) for Option Code P9).

Range 0: 0.5 psia and 750 psig (3, 4 bar and 51, 7 bar)

Range 1: 0.5 psia and 2000 psig (3, 4 bar and 137, 9 bar)

Burst Pressure Limits

3051C, 3051CF Coplanar or Traditional process flange

10000 psig (69 MPa)

3051T Inline

Ranges 1-4: 11000 psi (75,8 MPa)

Range 5: 26000 psig (179 MPa)

Failure Mode Alarm

If self-diagnostics detect a sensor or microprocessor failure, the analog signal is driven either high or low to alert the user. High or low failure mode is user-selectable with a jumper on the transmitter. The values to which the transmitter drives its output in failure mode depend on whether it is factory-configured to *standard* or *NAMUR-compliant* operation. The values for each are as follows:

Standard Operation			
Output Code	**Linear Output**	**Fail High**	**Fail Low**
A	3.9 ≤ I ≤ 20.8	I ≥ 21.75 mA	I ≤ 3.75 mA
M	0.97 ≤ V ≤ 5.2	V ≥ 5.4 V	V ≤ 0.95V

NAMUR-Compliant Operation			
Output Code	**Linear Output**	**Fail High**	**Fail Low**
A	3.8 ≤ I ≤ 20.5	I ≥ 22.5 mA	I ≤ 3.6 mA

Output Code F and W

If self-diagnostics detect a gross transmitter failure, that information gets passed as a status along with the process variable.

Temperature Limits

Ambient

-40 to 185 °F (-40 to 85 °C)

With LCD display(1): -4 to 175 °F (-20 to 80 °C)

Storage

-50 to 230 °F (-46 to 110 °C)

With LCD display: -40 to 185 °F (-40 to 85 °C)

Process

At atmospheric pressures and above. See Table 10

(1) LCD display may not be readable and LCD updates will be slower at temperatures below -4 °F (-20 °C).

Table 10. 3051 Process Temperature Limits

3051CD, 3051CG, 3051CF, 3051CA	
Silicone Fill Sensor(1)	
with Coplanar Flange	–40 to 250 °F (–40 to 121 °C)(2)
with Traditional Flange	–40 to 300 °F (–40 to 149 °C)(2)(3)
with Level Flange	–40 to 300 °F (–40 to 149 °C)(2)
with 305 Integral Manifold	–40 to 300 °F (–40 to 149 °C)(2)
Inert Fill Sensor(1)	0 to 185 °F (–18 to 85 °C)(4)(5)
3051T (Process Fill Fluid)	
Silicone Fill Sensor(1)	–40 to 250 °F (–40 to 121 °C)(2)
Inert Fill Sensor(1)	–22 to 250 °F (–30 to 121 °C)(2)
3051L Low-Side Temperature Limits	
Silicone Fill Sensor(1)	–40 to 250 °F (–40 to 121 °C)(2)
Inert Fill Sensor(1)	0 to 185 °F (–18 to 85 °C)(2)
3051L High-Side Temperature Limits (Process Fill Fluid)	
Syltherm® XLT	–100 to 300 °F (–73 to 149 °C)
D.C. Silicone 704®	32 to 400 °F (0 to 205 °C)
D.C. Silicone 200	–40 to 400 °F (–40 to 205 °C)
Inert	–50 to 350 °F (–45 to 177 °C)
Glycerin and Water	0 to 200 °F (–18 to 93 °C)
Neobee M-20	0 to 400 °F (–18 to 205 °C)
Propylene Glycol and Water	0 to 200 °F (–18 to 93 °C)

(1) Process temperatures above 185 °F (85 °C) require derating the ambient limits by a 1.5:1 ratio.

(2) 220 °F (104 °C) limit in vacuum service; 130 °F (54 °C) for pressures below 0.5 psia.

(3) 3051CD0 process temperature limits are –40 to 212 °F (–45 to 100 °C)

(4) 160 °F (71 °C) limit in vacuum service.

(5) Not available for 3051CA.

Humidity Limits

0–100% relative humidity

Turn-On Time

Performance within specifications less than 2.0 seconds (10.0 s for Profibus protocol) after power is applied to the transmitter

Volumetric Displacement

Less than 0.005 in^3 (0,08 cm^3)

Damping

4-20 mA HART

Analog output response to a step input change is user-selectable from 0 to 36 seconds for one time constant. This software damping is in addition to sensor module response time.

FOUNDATION fieldbus

Transducer block: 0.4 seconds fixed

AI Block: User configurable

Profibus PA

AI Block only: User configurable

PHYSICAL SPECIFICATIONS

Electrical Connections

1/2–14 NPT, PG 13.5, G1/2, and M20 × 1.5 (CM20) conduit. *HART* interface connections fixed to terminal block.

Process Connections

Rosemount 3051C

1/4–18 NPT on 2 1/8-in. centers
1/2–14 NPT on 2-, 2 1/8-, or 2 1/4-in. centers

Rosemount 3051L

High pressure side: 2-, 3-, or 4-in., ASME B 16.5 (ANSI) Class 150, 300 or 600 flange; 50, 80 or 100 mm, PN 40 or 10/16 flange
Low pressure side: 1/4–18 NPT on flange 1/2–14 NPT on adapter

Rosemount 3051T

1/2–14 NPT female. A DIN 16288 Male (available in SST for Range 1–4 transmitters only), or Autoclave type F-250-C (Pressure relieved 9/16–18 gland thread; 1/4 OD high pressure tube 60° cone; available in SST for Range 5 transmitters only).

Rosemount 3051CF

For 3051CFA, see 00813-01000-4485 in the 485 section
For 3051CFC, see 00813-01000-4485 in the 405 section
For 3051CFP, see 00813-01000-4485 in the 1195 section

Process-Wetted Parts

Drain/Vent Valves

316 SST, Alloy C-276, or Alloy 400 material (Alloy 400 not available with 3051L)

Process Flanges and Adapters

Plated carbon steel, SST cast CF-8M (cast version of 316 SST, material per ASTM-A743), C-Type cast alloy CW12MW, or cast alloy M30C

Wetted O-rings

Glass-filled PTFE or Graphite-filled PTFE

European Directive Information

The EC declaration of conformity for all applicable European directives for this product can be found on the Rosemount website at www.rosemount.com. A hard copy may be obtained by contacting an Emerson Process Management representative.

ATEX Directive (94/9/EC)
All 3051 transmitters comply with the ATEX Directive.

European Pressure Equipment Directive (PED) (97/23/EC)
3051CA4; 3051CG2, 3, 4, 5; 3051CD2, 3, 4, 5 *(also with P9 option)*; Pressure Transmitters
— QS Certificate of Assessment - EC No. PED-H-100 Module H Conformity Assessment

All other 3051/3001 Pressure Transmitters
— Sound Engineering Practice

Transmitter Attachments: Diaphragm Seal - Process Flange - Manifold
— Sound Engineering Practice

Electro Magnetic Compatibility (EMC) (2004/108/EC)
All 3051 Pressure Transmitters meet all of the requirements of EN61326: 1997 - A1, A2, and A3 and NAMUR NE-21

Ordinary Location Certification for Factory Mutual
As standard, the transmitter has been examined and tested to determine that the design meets basic electrical, mechanical, and fire protection requirements by FM, a nationally recognized testing laboratory (NRTL) as accredited by the Federal Occupational Safety and Health Administration (OSHA).

OPTIONS

Standard Configuration

Unless otherwise specified, transmitter is shipped as follows:

ENGINEERING UNITS	
***Differential/Gage*:**	inH_2O (Range 0, 1, 2, and 3) psi (Range 4 and 5)
***Absolute/3051TA*:**	psi (all ranges)
4 mA (1 V dc)[(1)]:	0 (engineering units above)
20 mA (5 V dc)[(1)]:	Upper range limit
Output:	Linear
Flange type:	Specified model code option
Flange material:	Specified model code option
O-ring material:	Specified model code option
Drain/vent:	Specified model code option
LCD Display:	Installed or none
Alarm[(1)]:	High
Software tag:	(Blank)

(1) Not applicable to FOUNDATION fieldbus or Profibus PA.

Custom Configuration[(1)]

If Option Code C1 is ordered, the customer may specify the following data in addition to the standard configuration parameters.

- Output Information
- Transmitter Information
- LCD display Configuration
- Hardware Selectable Information
- Signal Selection

Refer to the "Rosemount 3051 Configuration Data Sheet" document number 00806-0100-4001.

Tagging (3 options available)

- Standard SST hardware tag is wired to the transmitter. Tag character height is 0.125 in. (3,18 mm), 56 characters maximum.
- Tag may be permanently stamped on transmitter nameplate upon request, 56 characters maximum.
- Tag may be stored in transmitter memory (30 characters maximum). Software tag is left blank unless specified.

Commissioning Tag[(2)]

A temporary commissioning tag is attached to all transmitters. The tag indicates the device ID and allows an area for writing the location.

Optional Rosemount 304, 305 or 306 Integral Manifolds

Factory assembled to 3051C and 3051T transmitters. Refer to the following Product Data Sheet (document number 00813-0100-4839 for Rosemount 304 and 00813-0100-4733 for Rosemount 305 and 306) for additional information.

(1) Not applicable to FOUNDATION fieldbus or Profibus PA protocols.
(2) Only applicable to FOUNDATION fieldbus.

Other Seals

Refer to Product Data Sheet 00813-0100-4016 for additional information.

Output Information

Output range points must be the same unit of measure. Available units of measure include:

Pressure			
atm	inH2O@4 °C[(1)]	g/cm^2	psi
mbar	mmH_2O	kg/cm^2	torr
bar	mmHg	Pa	
inH_20	mmH2O@4 °C[(1)]	kPa	
inHg	ftH_20	MPa[(2)]	
Flow[(2)(3)]			
bbl	kg	cm^3	
ft^3	lb	m^3	
gal	L	ton	
Level[(2)]			
%	ft	cm	
in	mm		

(1) Only available on 4-20mA HART.

(2) Only available on Profibus PA.

(3) All flow units are available per second, minute, hour or day.

Display and Interface options

M4 Digital Display with Local Operator Interface (LOI)

- Available for Profibus PA
- Commission the device with external Local Configuration Buttons
- LOI Menu includes: Address, Units, Calibration, Damping, Display, Identification Number

M5 Digital Display

- 2-Line, 5-Digit LCD for 4-20 mA HART
- 1-Line, 4-Digit LCD for 1-5 Vdc HART Low Power
- 2-Line, 8-Digit LCD for FOUNDATION fieldbus and Profibus PA
- Direct reading of digital data for higher accuracy
- Displays user-defined flow, level, volume, or pressure units
- Displays diagnostic messages for local troubleshooting
- 90-degree rotation capability for easy viewing

M6 Digital Display with 316 Stainless Steel Cover

- For use with stainless steel housing option (housing codes J, K, and L)

Local Span and Zero Adjustment[(1)]

4-20 mA HART and 1-5 Vdc HART Low Power transmitters ship with local span and zero adjustments standard unless otherwise specified.

- Non-interactive external zero and span adjustments ease calibration
- Magnetic switches replace standard potentiometer adjustments to optimize performance

J1 Local Zero Adjustment Only[(1)]

J3 No Local Zero or Span Adjustment[(1)]

Transient Protection

T1 Integral Transient Protection Terminal Block
Meets IEEE C62.41, Category Location B
6 kV crest (0.5 ms - 100 kHz)
3 kV crest (8 × 20 microseconds)
6 kV crest (1.2 × 50 microseconds)

Bolts for Flanges and Adapters

- Options permit bolts for flanges and adapters to be obtained in various materials
- Standard material is plated carbon steel per ASTM A449, Type 1

L4 Austenitic 316 Stainless Steel Bolts
L5 ASTM A 193, Grade B7M Bolts
L6 Alloy K-500 Bolts

Conduit Plug

Single carbon steel plug ships standard, not installed in the transmitter

Rosemount 3051C Coplanar Flange and 3051T Bracket Option

B4 Bracket for 2-in. Pipe or Panel Mounting
- For use with the standard Coplanar flange configuration
- Bracket for mounting of transmitter on 2-in. pipe or panel
- Stainless steel construction with stainless steel bolts

Traditional Flange Bracket Options

B1 Bracket for 2-in. Pipe Mounting
- For use with the traditional flange option
- Bracket for mounting on 2-in. pipe
- Carbon steel construction with carbon steel bolts
- Coated with polyurethane paint

B2 Bracket for Panel Mounting
- For use with the traditional flange option
- Bracket for mounting transmitter on wall or panel
- Carbon steel construction with carbon steel bolts
- Coated with polyurethane paint

B3 Flat Bracket for 2-in. Pipe Mounting
- For use with the traditional flange option
- Bracket for vertical mounting of transmitter on 2-in. pipe
- Carbon steel construction with carbon steel bolts
- Coated with polyurethane paint

B7 B1 Bracket with SST Bolts
- Same bracket as the B1 option with Series 300 stainless steel bolts

B8 B2 Bracket with SST Bolts
- Same bracket as the B2 option with Series 300 stainless steel bolts

B9 B3 Bracket with SST Bolts
- Same bracket as the B3 option with Series 300 stainless steel bolts

BA Stainless Steel B1 Bracket with SST Bolts
- B1 bracket in stainless steel with Series 300 stainless steel bolts

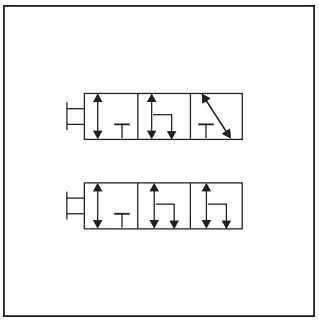
BC Stainless Steel B3 Bracket with SST Bolts
- B3 bracket in stainless steel with Series 300 stainless steel bolts

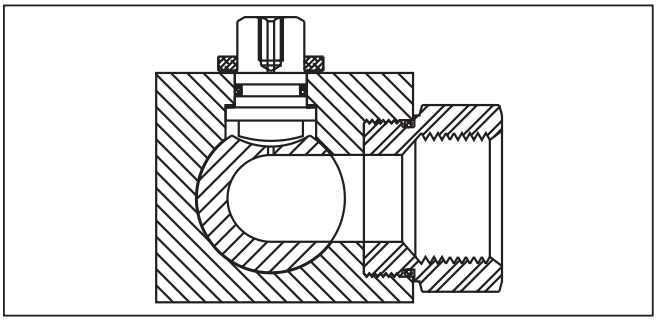
General Description

The BV3D Series is a 3-way diverter. The product is rated at 207 Bar (3000 PSI) and designed to economically satisfy many 3-way applications.

Operation

The BV3D Series operates by rotating the handle 90° or 180° depending on the chosen ball pattern. There is a slight port to port overlap.





Specifications

Maximum Pressure	207 Bar (3000 PSI)
Body Material	Carbon Steel, Black Oxide
Ball Material	Steel, Chrome Plated
Stem Material	Steel, Zinc Plated
Standard Handle	Steel Offset, Nickel Plated
Ball Seals	Delrin + MoS_2
Spindle Seals	O-Ring & Backup, Nitrile
Operating Temperature	-30°C to +100°C (-22°F to +212°F)

Features

- The standard L-bore ball and T-bore option allows the valve to be utilized in a variety of applications.
- Slight port overlap reduces upstream shock during shifting.
- Utilizing the unique spindle thrust bearing design reduces actuation torque.
- The BV3D can be panel mounted which allows a variety of installation options.
- Delrin seals with molybdenum disulphide (MoS_2) results in lower actuation torque and will increase high duty life cycle expectancy.

General Description

Parker cavity plugs can be used in any Integrated Hydraulic Circuit where one valve serves several machines and/or options. Two machines may have identical circuits except for one having a pressure reducing function, and the other not having this function. The machine that does not require this function can have the pressure reducing function replaced by a cavity plug; thereby utilizing a common body for both machines.

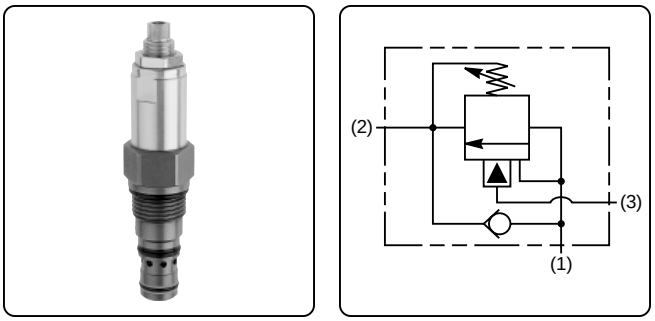
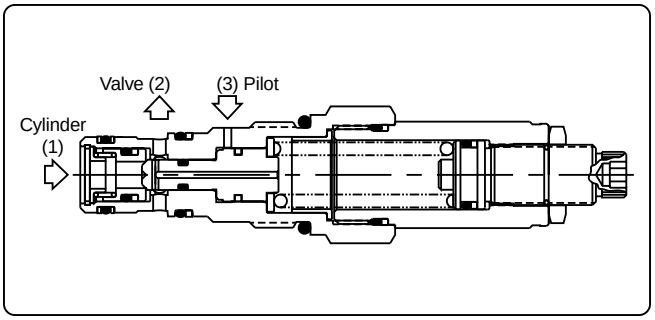
General Description

Cartridge Style Counterbalance Valve.
For additional information see Technical Tips on pages LM1-LM5.





Features

- Sealed spool type design for improved stability and accuracy as well as low leakage
- Low leakage poppet-type check valve for reliable load holding
- All external parts have yellow zinc dichromate finish.
- Parker cartridge design for ease of installation and maintenance
- Compact size for reduced space requirements

Specifications

Rated Flow	45 LPM (12 GPM)
Maximum Inlet Pressure	380 Bar (5500 PSI) - Steel 210 Bar (3000 PSI) - Aluminum
Maximum Setting Pressure	350 Bar (5000 PSI) - Steel 210 Bar (3000 PSI) - Aluminum

Parker Hannifin Corporation
Integrated Hydraulics Division
Lincolnshire, Illinois, USA

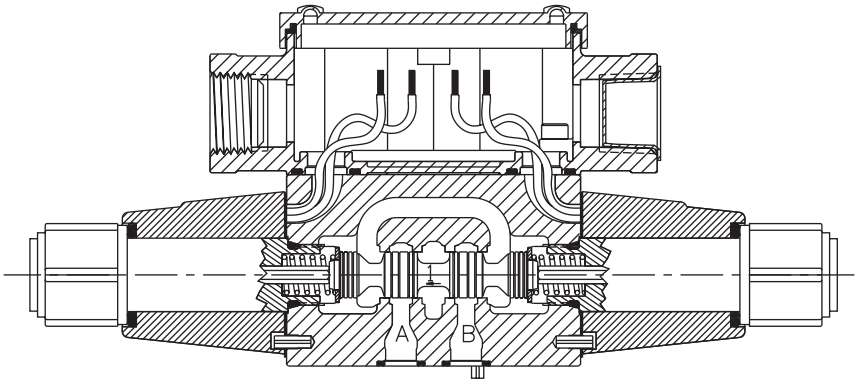
Application

Parker D1V Series hydraulic directional control valves are high performance, direct operated 4-way valves. They are available in 2 or 3 position styles. They are manifold mounted valves, which conform to NFPA's D03 mounting pattern. These valves were designed for industrial and mobile hydraulic applications which require high cycle rates, long life and high efficiency.

Operation

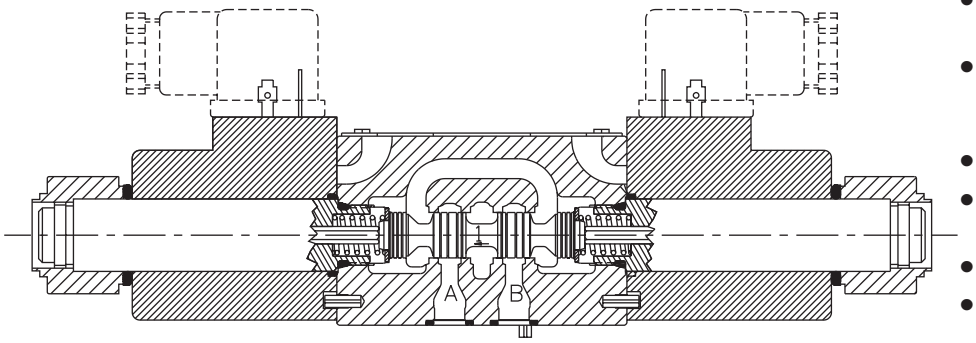
Parker's D1V Series directional control valves consist of a four chamber style body, and a case hardened sliding spool. The spool is directly shifted by a variety of operators including: solenoid, lever, cam, air or oil pilots.

D1VW Solenoid Operated Conduit Box Style



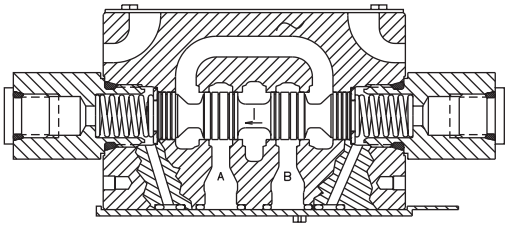
- Easy access mounting bolts
- Waterproof (NEMA 4 rated)
- No tools required for coil removal
- 21 spool styles available
- Four electrical connection options
- AC & DC lights available (CSA approval for solenoids and lights)

D1VW Solenoid Operated Hirschmann (DIN) Style



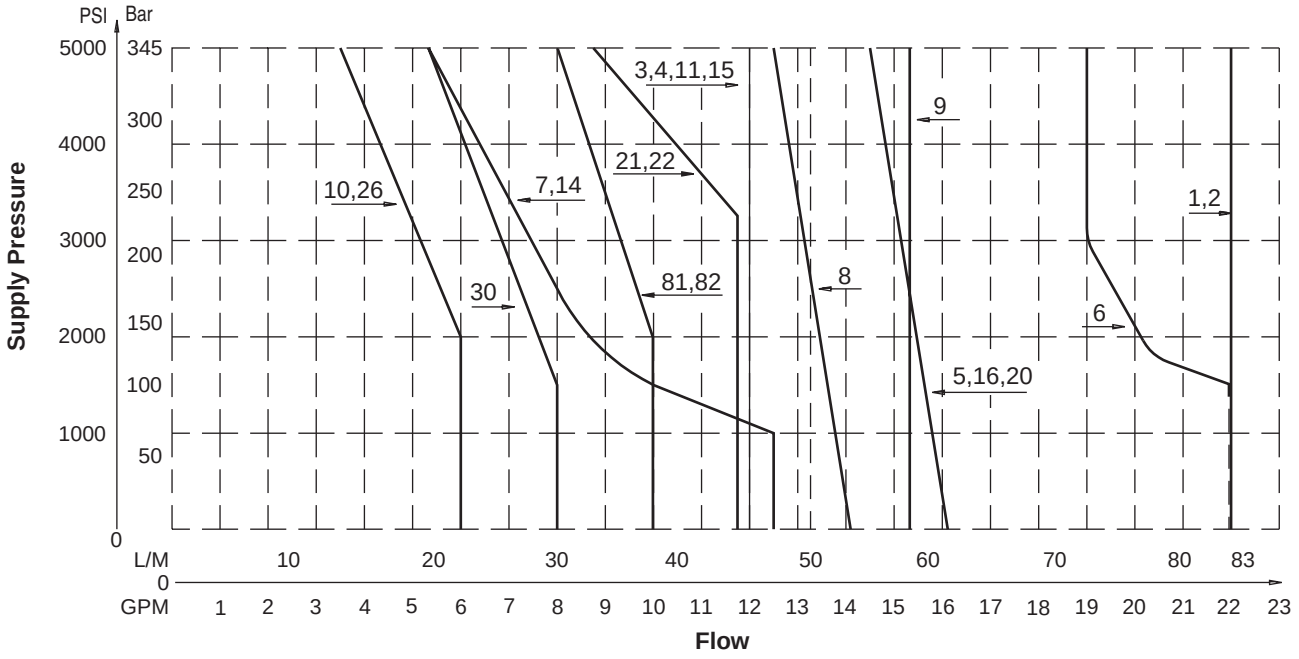
- DIN Style (43650) Hirschmann
- Dual and single spade (SAE type 1B) lug styles also available
- 21 spool styles available
- No tools required for coil removal
- Easy coil replacement
- AC & DC lights available (CSA approval for solenoids and lights)

D1VP Oil Pilot Operated



- Subplate pilot option
- Pilot pressure: 15.2 Bar (220 PSI) to 207 Bar (3000 PSI)

D1V Shift Limits



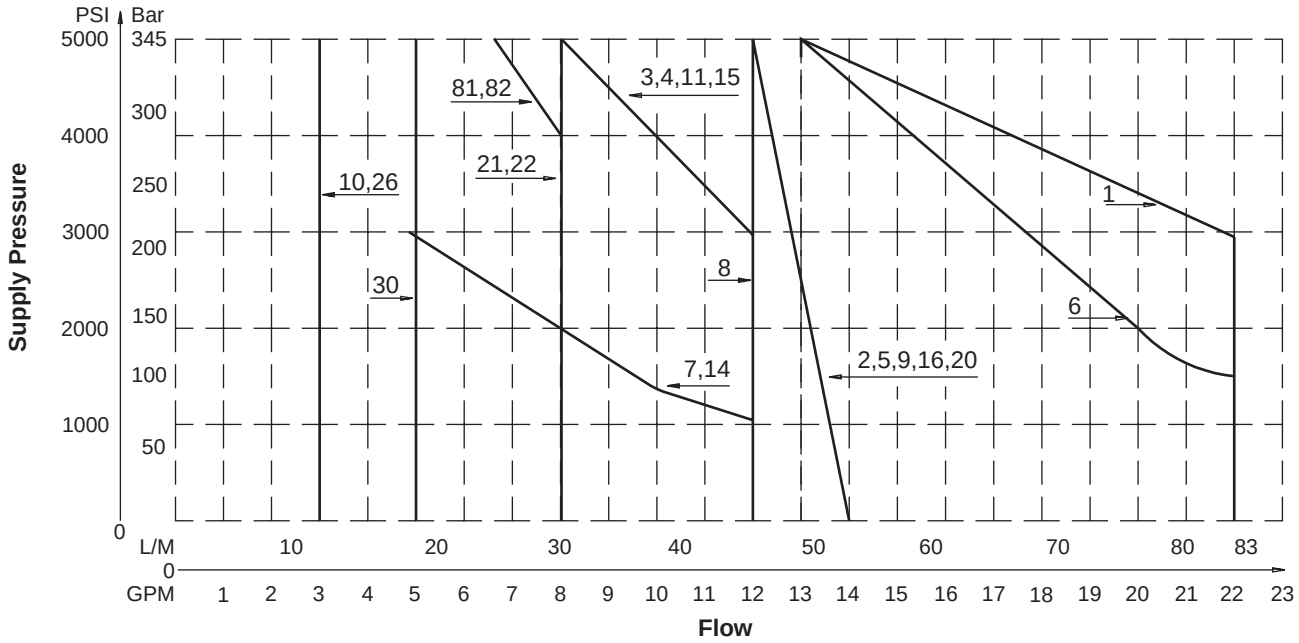
Example:

Determine the maximum allowable flow of a D1V Series valve (#30 spool) at 83 Bar (1200 PSI) supply pressure. Locate the curve marked “30”. At 83 Bar (1200 PSI) supply pressure, the maximum flow is 30 L/M (8 GPM). At 138 Bar (2000 PSI), the flow is 28 L/M (7.5 GPM)

Important Notes for Switching Limit Charts

1. For F & M style valves, reduce flow to 70% of that shown.
2. Shift limits charted for equal flow A and B ports. Unequal A and B port flows may reduce shift limits.

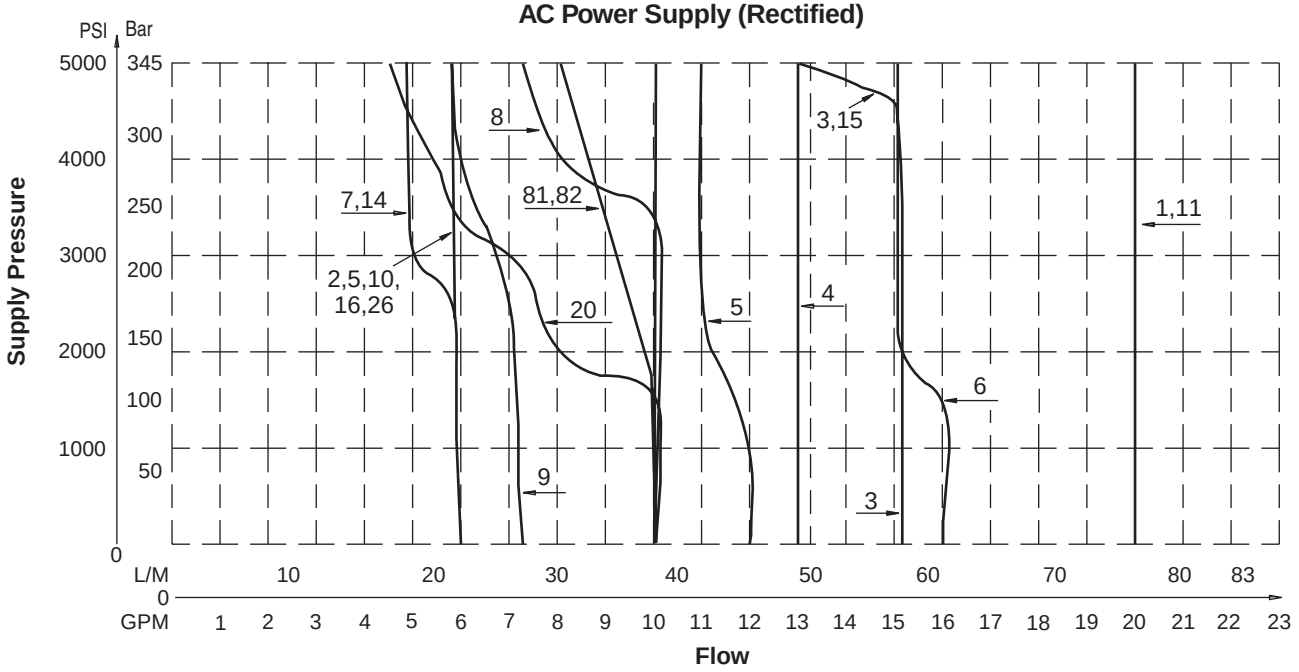
D1VW*****F Shift Limits



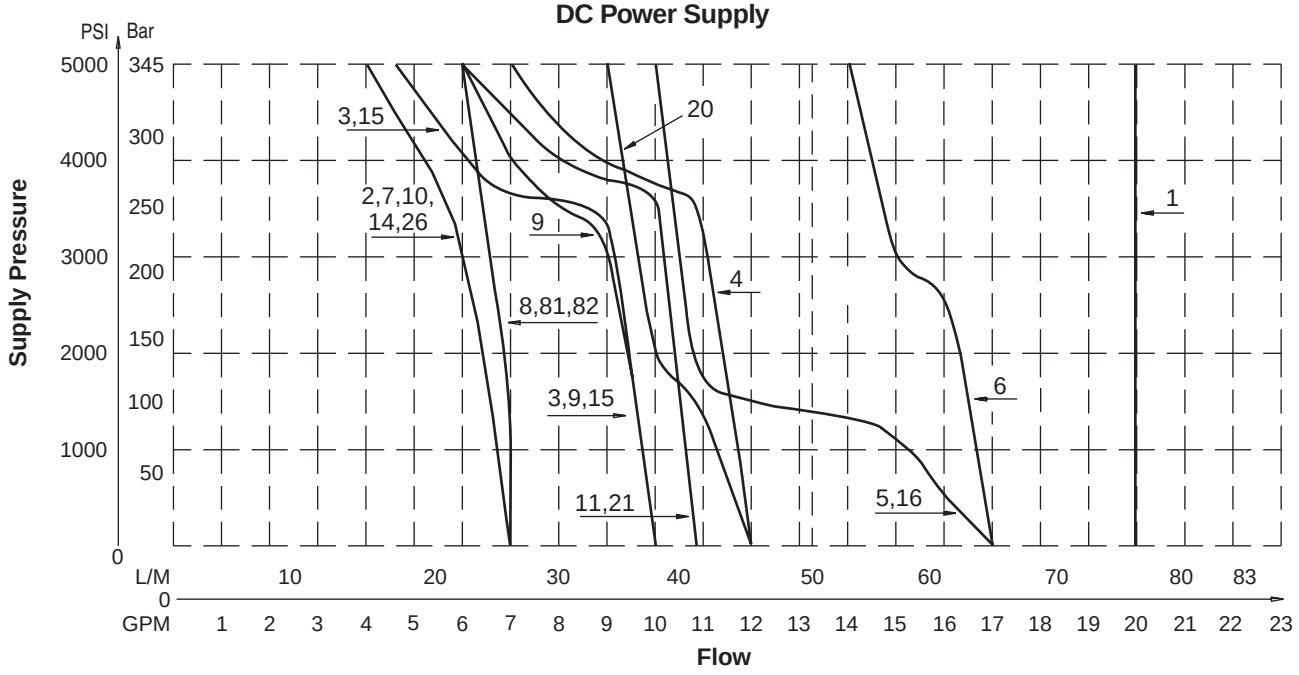
D1V.pm6, sm, hj

Soft Shift Limit Curves

AC Power Supply (Rectified)



DC Power Supply



Pressure Drop vs. Flow

The table to the right provides the flow vs. pressure drop curve reference for standard and high performance D1V Series valves by spool type.

The chart below demonstrates graphically the performance characteristics of the standard D1VW*****F and the high performance D1V. The low watt coil and other design features of the standards D1VW*****F accommodate a maximum flow of 50 L/M (13 GPM) at 345 Bar (5000 PSI).

Viscosity Correction Factor

Viscosity (SSU)	75	150	200	250	300	350	400
% of DP (Approx.)	93	111	119	126	132	137	141

Curves were generated using 100 SSU hydraulic oil.
For any other viscosity, pressure drop will change per chart.

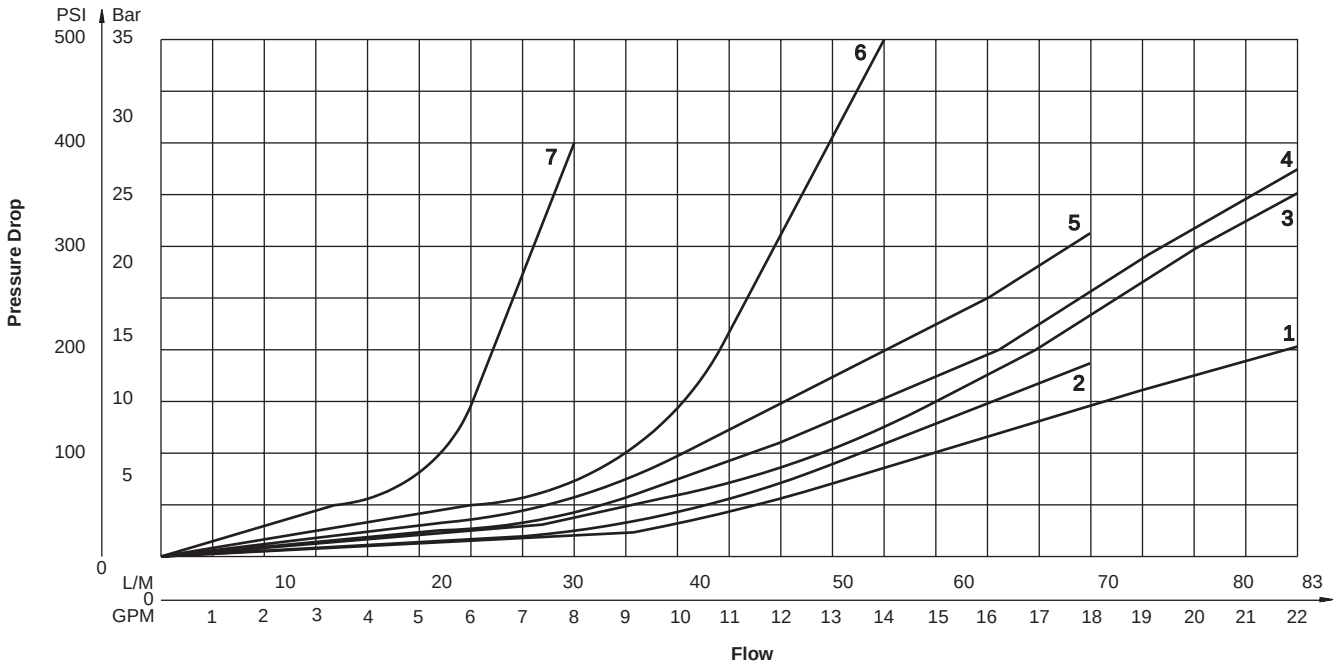
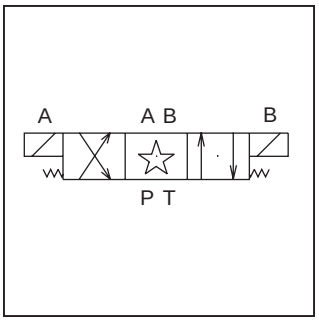
Performance Curves

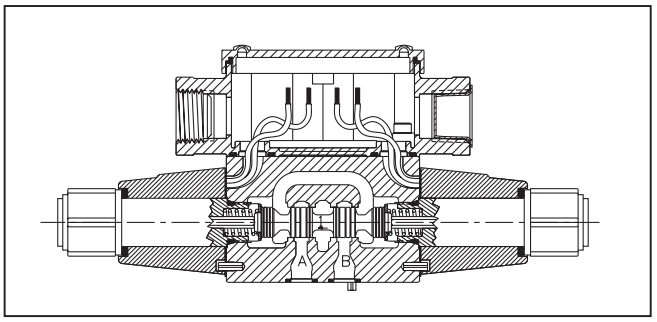


D1V.pm6, sm, hj

General Description

The D1VW Series directional control valves are high-performance, 4-chamber, direct operated, wet armature solenoid controlled, 3 or 4-way valves. They are available in 2 or 3-position and conform to NFPA's D03 mounting patterns.





Features

- Mechanically tunable soft shift.
- Proportional spools. 21 spool styles available.
- Repairable override
- DC surge suppression
- Four electrical connection options
- AC & DC lights available (CSA approval for solenoids and lights
- Internally ground
- Easy access mounting bolts
- Waterproof (NEMA 4 rated)
- Explosion proof
- CSA and UL approved
- No tools required for coil removal

Response Time*

Nominal response time (milliseconds) at 345 Bar (5000 PSI) is 32 L/M (8.5 GPM).

Solenoid Type	Pull-In	Drop-Out
AC	13	20
DC	32	40

* For soft shift, see ordering code X-number.

Fluid Recommendations

Premium quality hydraulic oil with a viscosity range between 150-250 SSU (32 -54 cst) at 38° C (100°F) is recommended. The absolute operation viscosity range is from 80-1000 SSU (16-220 cst). Oil should have maximum anti-wear properties and rust and oxidation treatments.

Fluids and Seals

Valves using synthetic, fire-resistant fluids require special seals. When phospate ester or its blends are used, FLUOROCARBON seals are required. Water-glycol, water-in-oil emulsions, and petroleum oil may be used with NITRILE seals.

Temperature Recommendation

Recommended oil temperature:
-7° to +71°C (-20 to +160°F)

Filtration

For maximum valve and system component life, the system should be protected at a contamination level not to exceed 125 particles greater than 10 microns per milliliter of fluid. (SAE Class 4 or better, ISO Code 16/13).

Tank Line Surges

If several valves are piped with a common tank line, flow surges in the line may cause unexpected spool shift. Detent style valves are most susceptible to this. Separate tank lines should be used when line surges are expected in an application.

Recommended Mounting Position

Valve Type	Recommended Mounting Position
Detent (Solenoid)	Horizontal
Spring Offset	Unrestricted
Spring Centered	Unrestricted

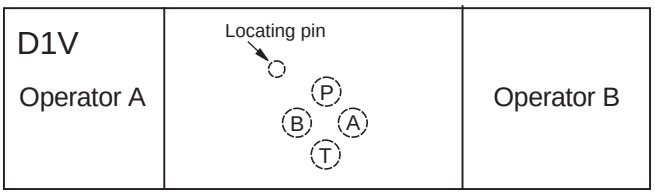
Silting

Silting can cause any sliding spool valve to stick and not spring return, if held shifted under pressure for long periods of time. The valve should be cycled periodically to prevent sticking.

Single Pass Operation

Valve flow ratings are for double pass operation (with equal flow in both paths). When using these components in single pass applications, flow capabilities may be reduced. Consult your local Parker representative for details.

Flow Path Data



*Note: On valves with 8 or 9 spool, A and/or B operators reverse sides. Flow paths remain the same as viewed from top of valve.

Double Solenoid. With solenoid "A" energized, flow path is P→A and B→T. When solenoid "B" is energized, flow path is P→B and A→T. The center condition on a spring-centered valve exists when both coils are de-energized, or during a complete shift, as the spool passes through center.

Detent and Spring Offset. The center condition exists on detent and spring offset valves only during spool crossover. To shift and hold a detented spool, only a momentary energizing of the solenoid is necessary. The minimum duration of the signal is aproximately 0.1 seconds for both AC and DC voltages. This position will be held provided the spool center line is in a horizontal plane, and no shock or vibration is present to displace the spool.

Single Solenoid. Spring offset valves can be ordered in six styles: B, E, F, H, K and M. Flow path data for the various styles are described in the order chart.

Lever Operated (on B end)

Pull lever away from valve P→A; B→T
Push lever toward valve P→B; A→T

Note: Reverse with a #8 or #9 spool.

Electrical Failure

Should electric power fail, spring offset and spring centered valves will shift to the spring held position. Detented valves will stay in the last position held before power failure. If main flow does not fail or stop simultaneously, machine actuators may continue to function in an undesirable manner or sequence.

Loss of Pilot Pressure (D1VA & D1VP)

Should a loss of pilot pressure occur, spring offset and spring centered valves will shift to the spring held position. Detented valves will remain in the last position held. If main hydraulic flow does not simultaneously stop, machine actuators may continue to function in an undesirable manner or sequence.

Torque Specifications

Torque values recommended for the bolts which mount the valve to the manifold or subplate are as follows:

#10-24 thread (M5-0.8) torque 5.6 Nm (50 in-lbs).

Subplate Mounting
NFPA D03, CETOP 3 & NG6.

Recommended Mounting Surface

Surface must be flat within .102 mm (0.0004 inch) T.I.R and smooth within 812.8 (32 micro-inch). Torque bolts to 5.6 N (50 in-lbs).

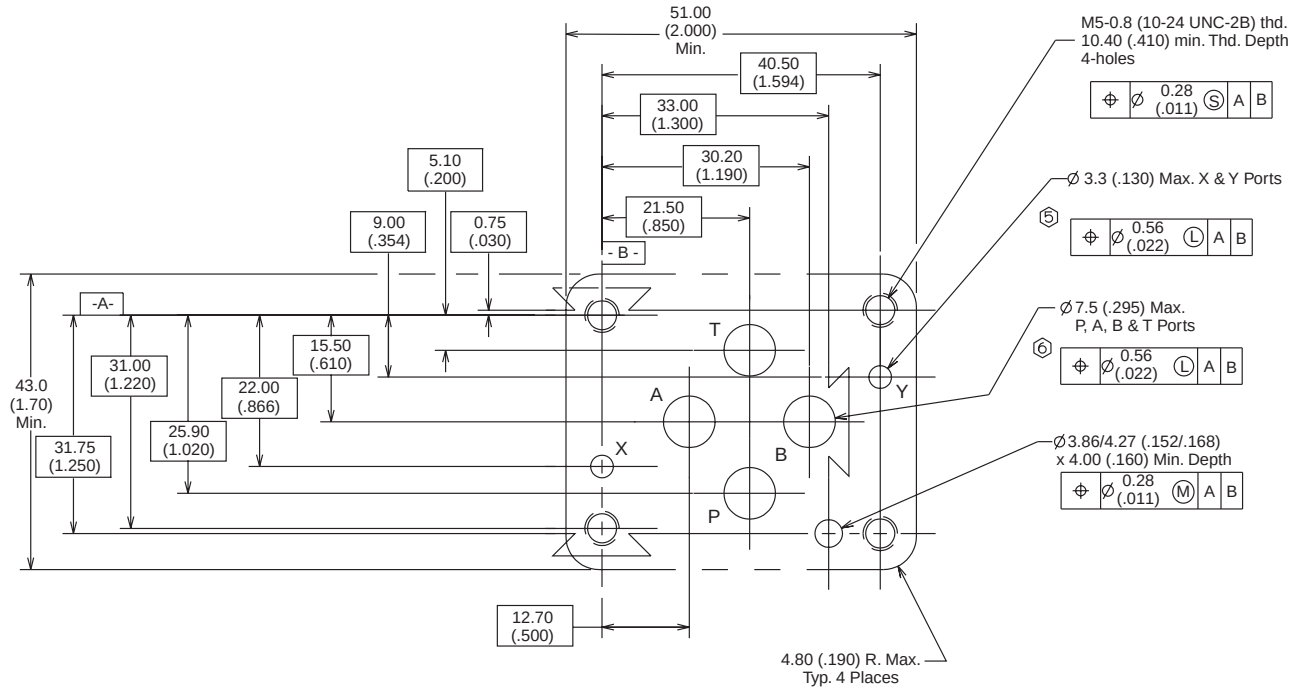
For maximum valve reliability, adhere to the following installation information.

Mounting Position

Valve Type	Mounting Position
Detent (Solenoid)	Horizontal
Spring Offset	Unrestricted
Spring Centered	Unrestricted

Mounting Pattern

Inch equivalents for millimeter dimensions are shown in (**).



Note: X and Y ports are required for subplate piloted D1VP valves only.

Mounting Bolt Kits

UNC Bolt Kits for use with D1V Directional Control Valves & Manapaks/Cartpaks (D1V*-70/75 Design, Solenoid Operated & D1V*-60 Design, Non-Solenoid Operated)

Note: All bolts are SAE Grade 8, 10-24 UNC–2A thread. Torque to 5.6 Nm (50 in-lb).

Sandwich Valve Dimensional Data

All D03 Manapak valves (starting with 31 Series) including CM2, CPOM2, FM2, PRM2 and RM2 measure 40mm (1.58") thickness. All D03 Cartpak bodies "A" through "H" also measure 40mm (1.58") thick.

For additional technical information about Manapak valvees, refer to the Manapak Sandwich Valve Catalog.

For additional technical information about Cartpak valves, refer to the Cartpak Sandwich Valve Catalog.

D1V.pm6, sm, hj

General Description

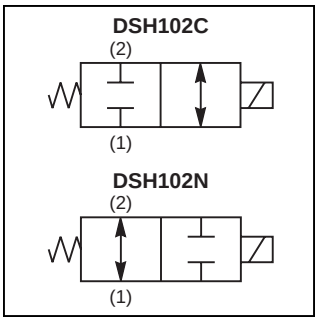
The DSH102, 2-way spool valves are used in circuits requiring flow to be blocked in both directions and/or flow to pass in both directions. When considering this valve series, allow for normal spool valve leakage. Normally open and normally closed configuration plus manual override models are available.

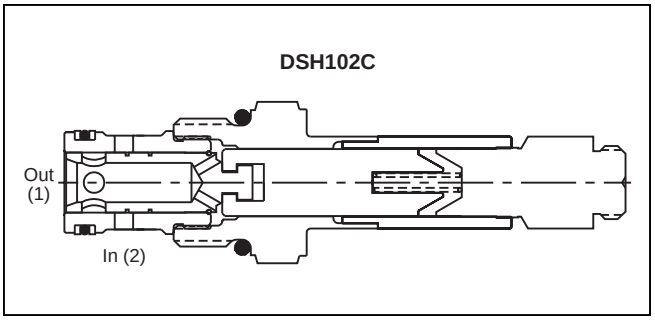
Operation

In the de-energized mode, the spool is positioned by spring force. The solenoid, when energized, directly shifts the spool against the spring, thus opening a normally closed valve or closing a normally open valve.

Specifications

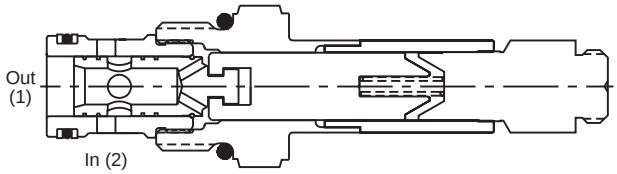
Rated Flow	**DSH102C** N.C. 30 LPM (8 GPM) **DSH102N** N.O. 26 LPM (7 GPM)
Maximum Inlet Pressure	345 Bar (5000 PSI) - Steel 210 Bar (3000 PSI) - Aluminum
Leakage	160 cc/min. (10 cu. in./min.) maximum at 345 Bar (5000 PSI)
Minimum Operating Voltage	90% of rated voltage at 345 Bar (5000 PSI)
Operating Temp. Range (Ambient)	-40°C to +93.3°C (Nitrile) (-40°F to +200°F) -31.7°C to +121.1°C (Fluorocarbon) (-25°F to +250°F)
Cartridge Material	All parts steel. All operating parts hardened steel.
Body Material	Steel or Aluminum
Filtration	ISO Code 16/13, SAE Class 4 or better
Mounting	No restrictions
Cavity	Common Cavity No. C10-2





Construction

DSH102N



Features

- High flow capacity with reduced space requirements
- Standard valve bodies and common cavities
- One-piece encapsulated coil with minimal amperage draw
- Manual overrides, seal variations and other options available
- No dynamic seals
- Variety of coil terminations

Shipping Weight
Cartridge Only .17 kg (.38 lbs.)
Cartridge in Body .62 kg (1.4 lbs.)

NOTE: If system pressure does not exceed 210 Bar (3000 PSI), aluminum bodies can be used. Higher pressures require steel bodies.

dsh102.pm6.5, bl, lk

Features

- **Integral Deutsch connector coil exceeds IP69K standards**
- Integral Deutsch connector coil thermal shock dunk test rated
- Integral Amp Jr. coil exceeds IP67 standards for thermal shock, water resistance and “dunk capability”
- Universal 50/60 Hz operation
- Coil hermetically sealed, requires no O-rings or waterproofing kits
- External plated steel flux-carrying band (unlike encapsulated band) enables coil to withstand severe thermal shocks without cracking
- Symmetrical coil can be reversed without affecting performance

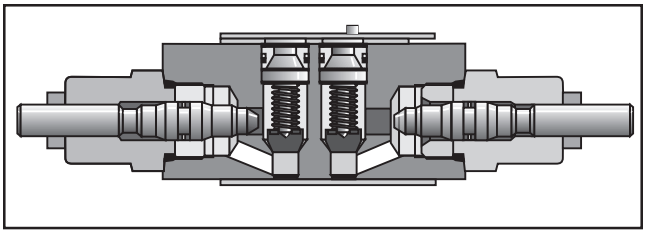
Flow Control Valves

Series FM

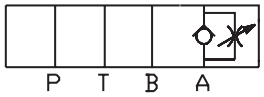


- Parker Manapak style FM flow control valves can be provided in either single or double configurations.

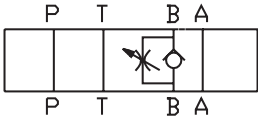
  The flow controls may be positioned in 'A' port or 'B' port; or both 'A' and 'B' ports.

- Valve bodies are manufactured from steel which provide extra strength and durability for longer life. Internal hardened steel components also provide longer life.
- Two step needles (standard) provide fine adjustment for the first three turns and course adjustment for the last three turns. Fine and microfine metering needles are available as an option.
- Large bypass checks allow high flow at a low pressure drop.
- Reversible (invert 180°) for meter-in or meter-out (D03 & D05 only).

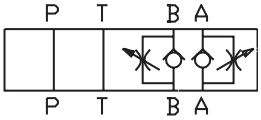
FM*AA
(Meter Out)



FM*BB
(Meter Out)

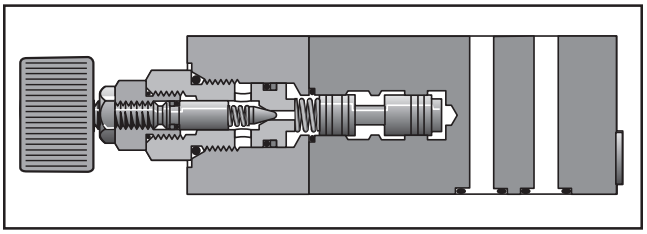


FM*DD
(Meter Out)



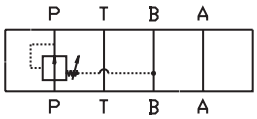
Pressure Reducing Valves

Series PRM

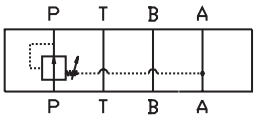


- Parker Manapak PRM sandwich style pressure reducing valves can be used to reduce pressure on the 'P' port, the 'A' port, or the 'B' port.
- Three pressure adjustment options available: slotted screw, knob and locking knob.
- Valve bodies are manufactured from steel which provide extra strength and durability for longer life. Internal hardened steel components also provide longer life.

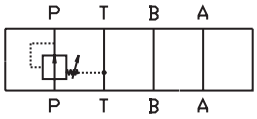
PRM*AA



PRM*BB

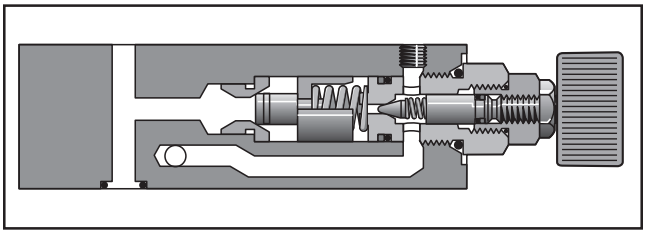


PRM*PP



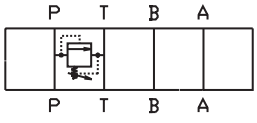
Pressure Relief Valves

Series RM



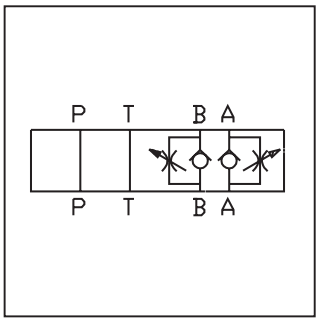
- Parker Manapak RM sandwich style relief valve is a 'P' port to 'T' port relief.
- Valve bodies are manufactured from steel which provide extra strength and durability for longer life. Internal hardened steel components also provide longer life.
- Three pressure adjustment options available: slotted screw, knob and locking knob.

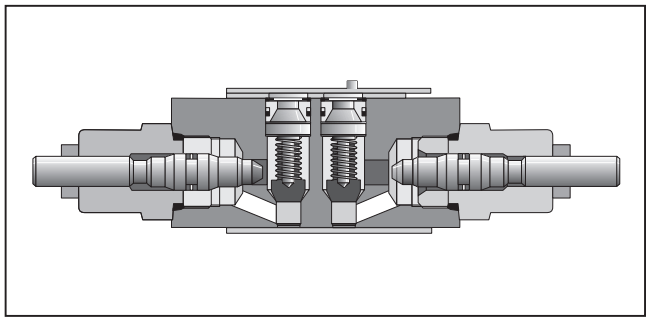
RM*PT



General Description

The FM double Manapak flow control valves permit free flow from the direction valve to the actuator and adjustable independent flow regulation in each return line from the actuator (meter-out). The FM2, and FM3 have a seal plate and can be inverted for meter-in applications (see installation drawing for flow direction).





Features

- Manapak style FM flow control valves can be provided in either single or double configurations.
- The flow controls may be positioned in 'A' port or 'B' port; or both 'A' and 'B' ports.
- Valve bodies are manufactured from steel providing extra strength and durability for longer life. Internal hardened steel components also provide longer life.
- Two step needles provides fine adjustment for the first three turns and course adjustment for the last three turns. Fine and micro fine adjustment available.
- Large bypass checks allow high flow at a low pressure drop.
- Reversible (invert 180°) for meter-in or meter-out (D03 and D05 size only).

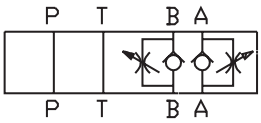
BB Option

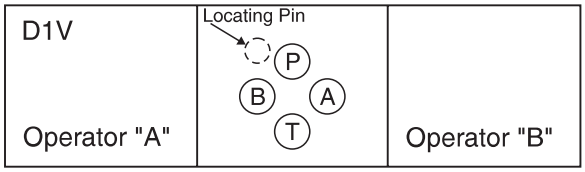


DD Option

CAUTION:

Manapak Installation

Prior to installation of Manapaks, please review flow paths. Due to the reversibility of the DO3 size, incorrect installation will alter the hydraulic circuit. Care must be taken during installation to insure that the Manapak is installed in compliance with the hydraulic schematic. Please consult with your Parker representative with any questions that may arise.



Pressure Ratings

Unless otherwise specified, all Parker Manapaks have continuous duty pressure rating as shown in this catalog.

Special Requirements

Consult your Parker representative for factory recommendations on such situations as:

- Installations that will operate at pressures higher than published catalog ratings.
- Use of hydraulic fluids which do not meet our recommended specifications.
- Operations where fluid temperature will exceed 121°C (250°F).

Recommended Mounting Surface

Surface must be flat within .0004 inch T.I.R. and smooth with 32 micro-inch.

System Cleanliness

Any hydraulic system that includes Parker valves should be carefully protected against dirt and fluid contamination. Life of the valves, as well as of all other components, will be greatly lengthened. Operation will be smoother and more precise. Maintenance and repairs will be reduced. Lost production because of low pressure and flow will be minimized. Fluid contamination should be maintained to less than 500 particles larger than 10 micrometers per milliliter of fluid (SAE class 4 or better/ISO Code 16/13).

Hydraulic Fluids

Parker recommends using top-quality hydraulic fluids having a viscosity range of 150 to 250 SSU (32 to 54 cst.) at 38°C (100°F). The absolute viscosity range should be 80 to 1000 SSU (16 to 220 cst.). Fluids should have highest anti-wear characteristics and be treated to avoid rust and oxidation.

Seals

When used with water-glycol, water/oil emulsions, and high-grade petroleum base hydraulic fluids, Parker standard nitrile seals are suitable.

When using phosphate ester fluids or their blends, specify Parker optional seals made of DuPont Viton. Synthetic fire-resistant fluids require special seal materials which your Parker representative can recommend.

Torque Specifications

The recommended torque valves are for the bolts which mount the valve to the manifold or subplate are as follows:

Size	Torque Valve
2	5.7 N.m. (50 in.-lbs.)
3	16.3 N.m. (12 ft.-lbs.)
6	108.5 N.m. (80 ft.-lbs.)

SERIES 5000
SOLENOID VALVE CONNECTORS

GENERAL PRODUCT OVERVIEW

General Description

The ISO and 8mm Sub-Micro connectors are made according to DIN 43650 / ISO 4400, EN175301-803:2000. The MINI and 9.4mm Sub-Micro connectors are industry standards. All are used as protective enclosures for electrical connection in conjunction with hydraulic and pneumatic solenoid valves. These connectors offer distinct advantages over "hardwired" solenoid valves because of their modular design. Used where rapid installation and service are a must. Better than molded construction when special wire is needed or when using one long wire run.

Ordering Example:

5137 - 1030007

Ground down, 3 ft wire length, lighted 48 - 120 VDC, 100 - 240 VAC 50/60 Hz, nitrile gasket, MINI 1/2" Conduit Connector, 2+ ground contacts

Each connector kit contains fastening hardware and gasket assembly.

* *NOT* Available in MINI
** *NOT* Available in Sub-Micro

Not all combinations are available. Consult factory for details.

† High Top Housing for easy wiring.

Consult factory for available versions listed by Canadian Standards Association for use with certified electrical equipment.

General Description

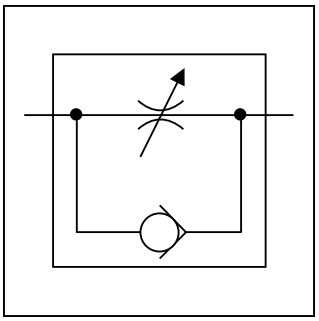
Series “F” flow control valves provide precise control of flow and shut-off in one direction, and automatically permit full flow in the opposite direction.

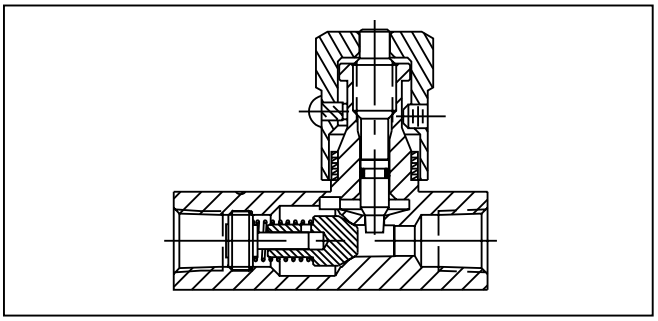
Operation

A two-step needle allows fine adjustment at low flow by using the first three turns of the adjusting knob. The next three turns open the valve to full flow, and also provide standard throttling adjustments.

Features

- The exclusive “Colorflow” color-band reference scale on the valve stem is a great convenience and time-saver in setting the valve originally and in returning it to any previous setting.
- A simple set screw locks the valve on any desired setting.
- A tamperproof option (T) feature is also available to prevent accidental or intentional adjustment of flow setting.





Specifications

Maximum Operating Pressure	Brass:	140 Bar (2000 PSI); except for F1600 brass which is 35 Bar (500 PSI)
	Steel & Stainless Steel:	345 Bar (5000 PSI) for 200 thru 1020; 207 Bar (3000 PSI) for all other sizes
Return Check Poppet, Nominal Cracking Pressure	0.4 Bar (5 PSI)	
Poppets	Soft seal poppet in brass 200 - 820 sizes Solid metal 416 stainless steel poppet on all other sizes and styles	
Operating Temperature	-40°C to +121°C (-40°F to +250°F)

Parker Heavy Duty Hydraulic Cylinders

Series 2H

Exclusive with the Parker Stepped Cushion for increased performance and productivity

- **Faster cycle time**
- **Reduced hydraulic shock**
- **Reduced machine noise**
- **Lower machine maintenance**

- **Heavy Duty Service – Industrial Tie-Rod Construction**
- **Nominal Pressure – 3000 PSI**
- **Standard Bore Sizes – 1-1/2" through 6"**
- **Piston Rod Diameters – 5/8" through 4"**
- **18 Standard Mounting Styles**

For Cylinder Division Plant Locations – See Page II.

Series 2H
Heavy Duty Hydraulic Cylinders

Standard Specifications

- Heavy Duty Service – NFPA specifications and ANSI B93.15-1981 mounting dimension standards
- Standard Construction – Square Head – Tie Rod Design
- Nominal Pressure – 3000 P.S.I.*
- Standard Fluid – Hydraulic Oil
- Standard Temperature – -10½ F to +165½ F**
- Bore Sizes – 1½" through 6" (Larger sizes available)
- Piston Rod Diameter – ⅝" through 4"
- Mounting Styles – 18 standard styles at various application ratings
- Strokes – Available in any practical stroke length
- Cushions – Optional at either end or both ends of stroke. "Float Check" at cap end.
- Rod Ends – Three Standard Choices – Specials to Order

*If hydraulic operating pressure exceeds 3000 P.S.I., send application data for engineering evaluation and recommendation. See section C, page 84 for actual design factors.

** See section C, page 83 for higher temperature service.

In line with our policy of continuing product improvement, specifications in this catalog are subject to change.

Note: Series 2H Hydraulic Cylinders fully meet N.F.P.A. Standards and ANSI Standard B93.15-1981 for Mounting Dimensions for Square Head Industrial Fluid Power Cylinders.

Parker
Cylinder

B

The inside story on why series 2H is your best choice in heavy duty hydraulic cylinders

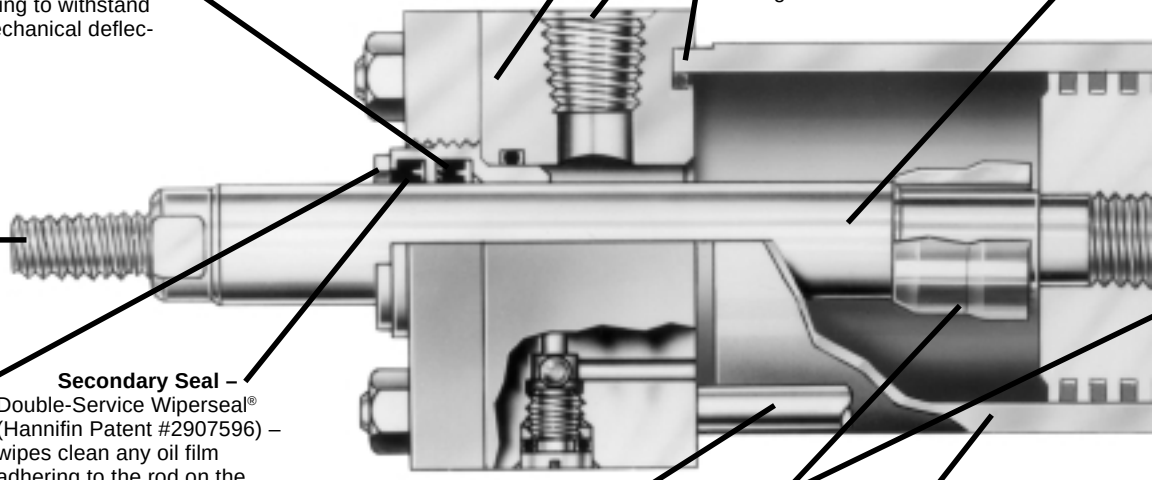
Steel Head – Bored and grooved to provide concentricity for mating parts.

Ports – S.A.E. "O" ring ports are standard.

End Seals – Pressure-actuated cylinder body-to-head and cap "O" rings.

Primary Seal – New TS-2000 Rod Seal is a proven leakproof design – completely self-compensating and self-relieving to withstand variations and conform to mechanical deflection that may occur.

Piston Rod Stud – Furnished on 2" diameter rods and smaller when standard style #4 rod end threads are required or on $1^{3}/_{8}$" diameter rods and smaller when style #8 threads are required. Also available in 2 times the catalog "A" dimension length. Studs have rolled threads and are made from high strength steel. Anaerobic adhesive is used to permanently lock the stud to the piston rod.

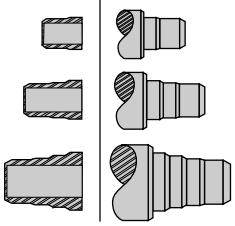


"Jewel" Rod Gland Assembly – Externally removable without cylinder disassembly. Long bearing surface is inboard of the seals, assuring positive lubrication from within the cylinder. An "O" ring is used as a seal between gland and head, and also serves as a prevailing torque-type lock.

Secondary Seal – Double-Service Wiperseal® (Hannifin Patent #2907596) – wipes clean any oil film adhering to the rod on the extend stroke and cleans the rod on the return stroke.

Stepped Cushions

Sleeve Design | Spear Design



High Strength Tie Rods – Made from 100,000 psi minimum yield steel with rolled threads for added strength.

The Cylinder Body – Heavy-wall steel tubing, honed to a micro finish bore.

Adjustable Floating Stepped Cushions – For maximum performance – economical and flexible for even the most demanding applications – provides superior performance in reducing shock. Cushions are optional and can be supplied at head end, cap end, or both ends without change in envelope or mounting dimensions.

Parker's New, Exclusive
Stepped floating cushions combine the best features of known cushion technology.

Deceleration devices or built-in "cushions" are optional and can be supplied at head end, cap end, or both ends without change in envelope or mounting dimensions. Parker cylinder cushions are a stepped design and combine the best features of known cushion technology.

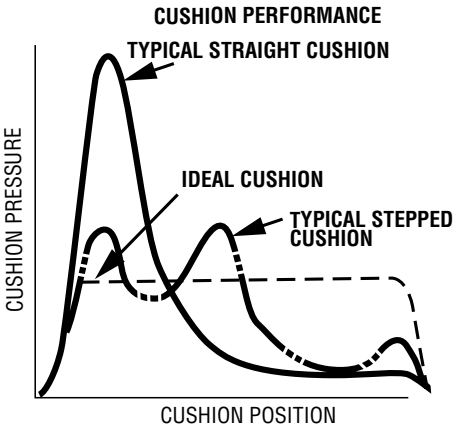
Standard straight or tapered cushions have been used in industrial cylinders over a very broad range of applications. Parker research has found that both designs have their limitations.

As a result, Parker has taken a new approach in cushioning of industrial hydraulic cylinders and for specific load and velocity conditions have been able to obtain deceleration curves that come very close to the ideal. The success lies in a stepped sleeve or spear concept where the steps are calculated to approximate theoretical orifice areas curves.

In the cushion performance chart, pressure traces show the results of typical orifice flow conditions. Tests of a three-step sleeve or spear show three pressure pulses coinciding with the steps. The deceleration cushion plunger curves shape comes very close to being theoretical, with the exception of the last $^{1}/_{2}$ inch of travel. This is a constant shape in order to have some flexibility in application. The stepped cushion design shows reduced pressure peaks for most load and speed conditions, with comparable reduction of objectionable stopping forces being transmitted to the load and the support structure.

All Parker Hannifin cushions are adjustable.

The Series 2H cylinder design incorporates the longest cushion sleeve and cushion spear that can be provided in the standard envelope without decreasing the rod bearing and piston bearing strengths.



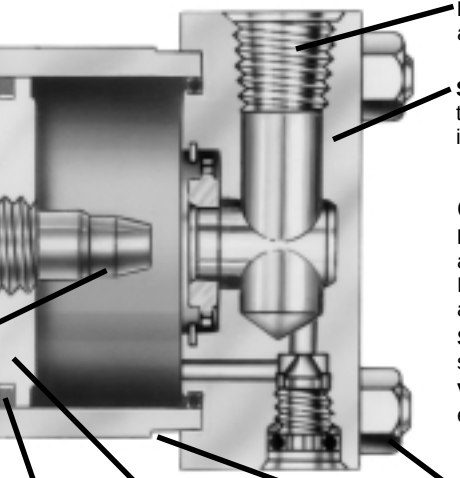
(1) When a cushion is specified at the head end:

a. A self-centering stepped sleeve is furnished on the piston rod assembly.

b. A needle valve is provided that is flush with the side of the

For additional information – call your local Parker Cylinder Distributor.

Piston Rod – Medium carbon steel, induction case-hardened to 54 R_c, hard chrome-plated and polished to 10 RMS finish. Piston rods are made from 90,000 to 100,000 psi minimum yield material in $^5/_8$" through 4" diameters. Larger diameters vary between 57,000 and 90,000 psi minimum material, depending on rod diameter. The piston thread equals the catalog style #4 rod end thread for each rod diameter to assure proper piston-to-rod thread strength. Two wrench flats are provided for rod end attachment.



Ports – S.A.E. "O" ring ports are standard.

Steel Cap – Bored and grooved to provide concentricity for mating parts.

Optional Ports

Ports – N.P.T.F. ports are optional at no extra charge. Oversize N.P.T.F. and S.A.E. ports are available at extra charge.

Seals – Buna-N (Nitrile) seals are standard.

Viton Seals – Optional at extra charge.

Alloy Steel Tie Rod Nuts

Align-A-Groove – (Patent #3043639) – A $^3/_{16}$" wide surface machined at each end of the cylinder body. Makes precise mounting quick and easy.

One-Piece Fine Grained Cast Iron Piston – The wide piston surface contacting cylinder bore reduces bearing loads, and a long thread engagement with rod provides greater shock absorption. Anaerobic adhesive is used to permanently lock and seal the piston to the rod.

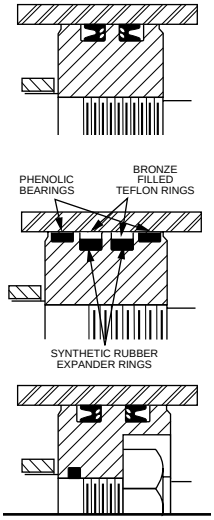
Step Cut Iron Piston Rings are standard.

The exclusive "Jewel" gland gives you longer cylinder life, better performance and lower costs.

An extra-long inboard bearing surface insures lubrication from within the cylinder. Outboard of the bearing surface are two leakproof seals – The TS-2000 and Wiperseal. The serrated TS-2000 (primary seal) is completely self-compensating and self-relieving. It adjusts to mechanical deflections or any pressure variation from near-zero to rated operating pressure. The result is positive, no-leak sealing – regardless of conditions.

The Wiperseal does double duty. On the advance stroke, it acts as a secondary pressure seal. On the return, it wipes away any dirt on the rod. This means less wear on bearing surfaces and internal parts. Longer life for working parts. And, less loss of fluid. Plus, you can replace a "Jewel" gland without removing the tie rods or the retainer. Just a few twists with a spanner wrench does the job.

Optional Pistons



Lipseal® Piston – Optional at no extra charge. Zero leakage under static conditions for hydraulic pressures up to 3000 psi. Seals are self-compensating to conform to variations in pressure, mechanical deflection, and wear. Back-up washers prevent extrusion.

Hi Load Piston – Optional at extra charge. Includes wear rings and bronze-filled teflon seals. Two wear rings serve as bearings which deform radially under side-loading, enabling the load to be spread over a larger area and reduce unit loading. Bronze-filled teflon seals are designed for extrusion-free, leak-proof service and longer cylinder life than the lipseal type piston.

Nut Retained Piston – Optional at extra charge.

B

head even when wide open. It may be identified by the fact that it is socket-keyed. It is located on side number 2, in all mounting styles except D, DB, DD, JJ, HH and E. In these styles it is located on side number 3.

c. On 5" bore and larger cylinders (except for $2^1/_2$" bore with code 2 rod), a springless check valve is provided that is also flush with the side of the head and is mounted adjacent to the needle valve except on mounting style C, where it is mounted opposite the needle valve. It may be identified by the fact that it is slotted.

d. On $1^1/_2$" - 4" bore cylinders a slotted sleeve design is used in place of the check valve.

e. $1^1/_2$" - 2" bore cylinders use a cartridge style needle valve (see Figure A).

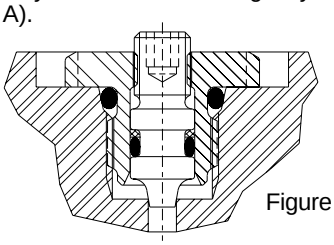


Figure A

(2) When a cushion is specified at the cap end:

a. A cushion stepped spear is provided on the piston rod.

b. A "float check" self-centering bushing is provided which incorporates a large flow check valve for fast "out-stroke" action.

c. A socket-keyed needle valve is provided that is flush with the side of the cap when wide open. It is located on side number 2 in all mounting styles except D, DB, DD, JJ, HH and E. In these styles it is located on side number 3.

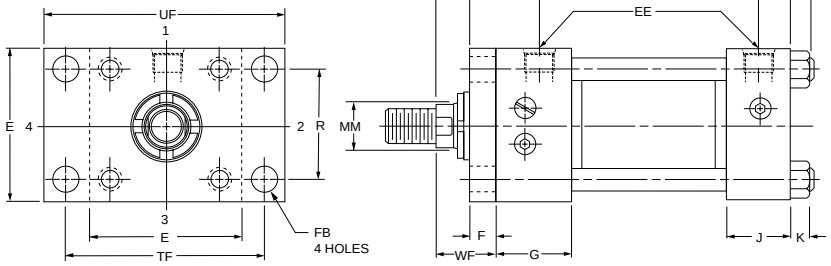
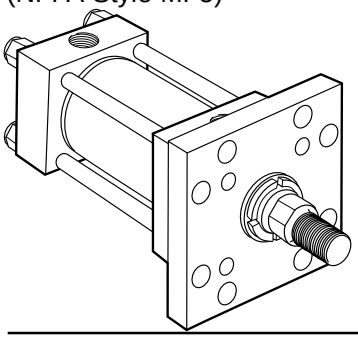
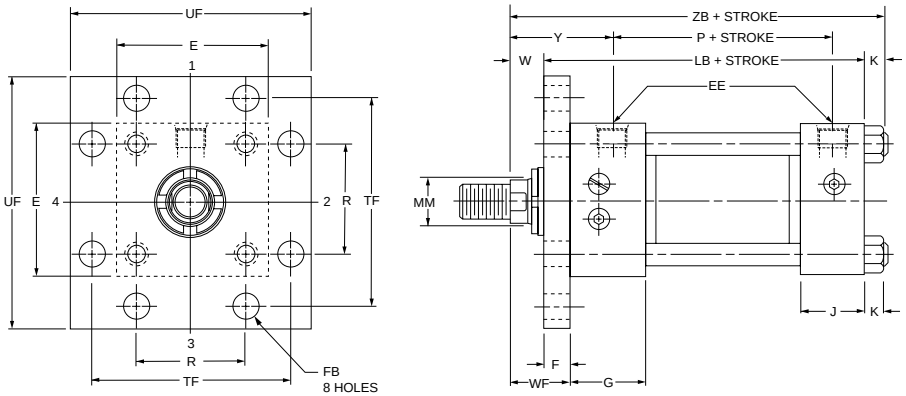
For pressures exceeding those shown use mounting styles JB or JJ.

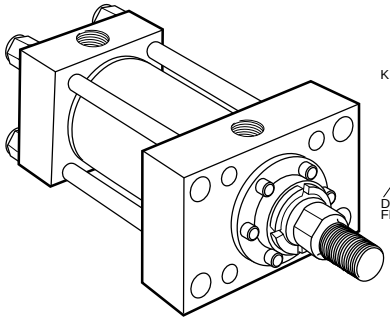


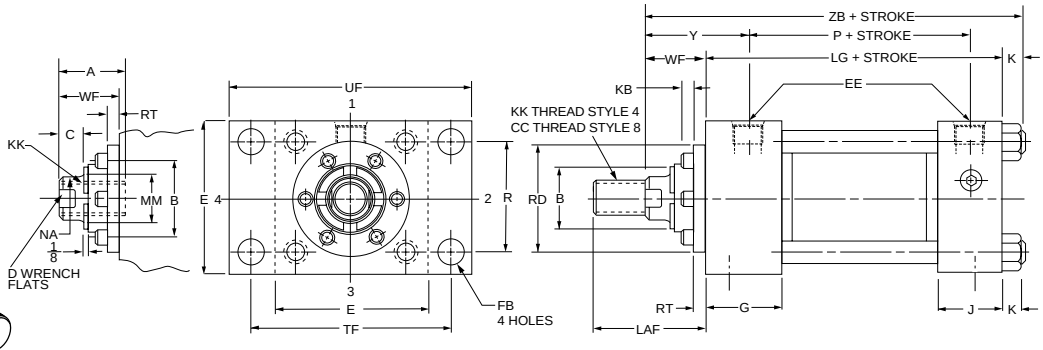
Head Square Flange Mounting Style JB
(NFPA Style MF5)





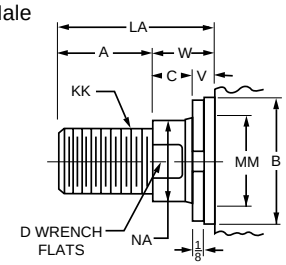
Head Rectangular Mounting Style JJ
(NFPA Style ME5)





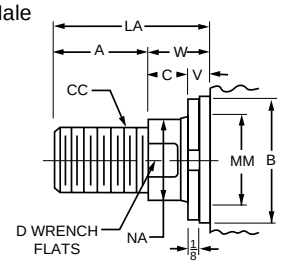
Rod End Dimensions — see table 2

Thread Style 4
(NFPA Style SM)
Small Male



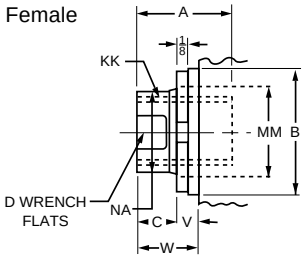
A high strength rod end stud is supplied on thread style 4 through 2" diameter rods and on thread style 8 through 1⅜" diameter rods. Larger sizes or special rod ends are cut threads. Style 4 rod ends are recommended where the workpiece is secured against the rod shoulder.

Thread Style 8
(NFPA Style IM)
Intermediate Male



When the workpiece is not shouldered, style 4 rod ends are recommended through 2" piston rod diameters and style 8 rod ends are recommended on larger diameters. Use style 9 for applications where female rod end threads are required. If rod end is not specified, style 4 will be supplied.

Thread Style 9
(NFPA Style SF)
Small Female



"Special" Thread Style 3

Special thread, extension, rod eye, blank, etc., are also available.

To order, specify "Style 3" and give desired dimensions for CC or KK, A and LA. If otherwise special, furnish dimensioned sketch.

For additional information – call your local Parker Cylinder Distributor.

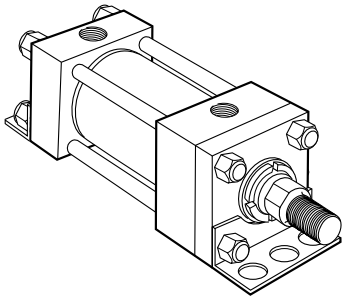
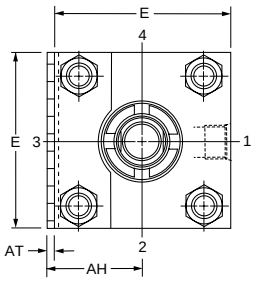
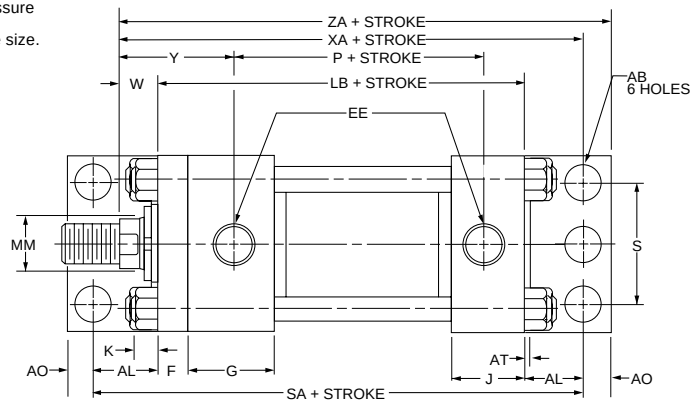
Series 2H
Heavy Duty Hydraulic Cylinders

Side End Angles Mounting Style CB
(NFPA Style MS1)

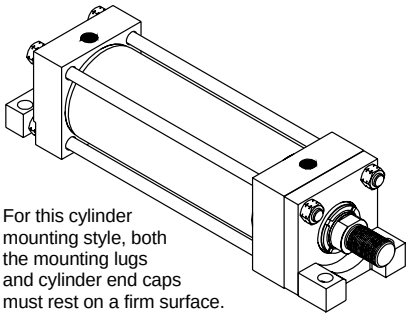
The maximum recommended operating pressure for Style CB is 500 psi. The recommended minimum stroke length is two times the bore size.



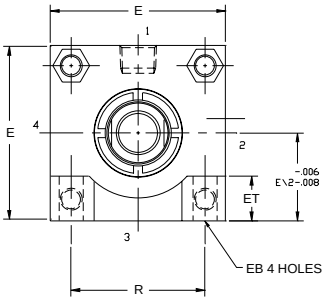


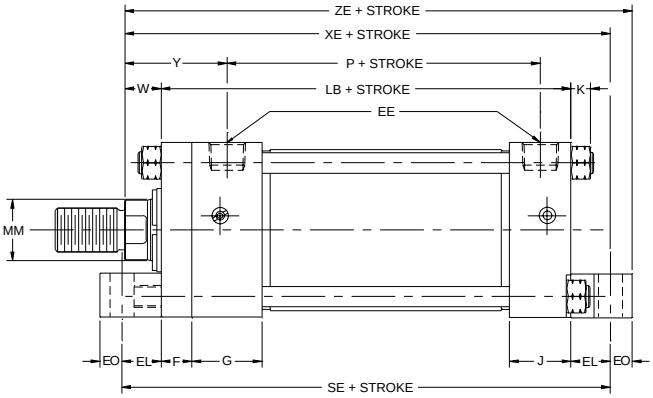


Side End Lugs Mounting Style G
(NFPA Style MS7)

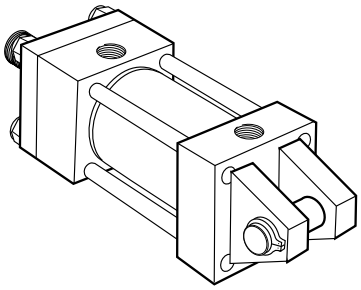


For this cylinder mounting style, both the mounting lugs and cylinder end caps must rest on a firm surface.

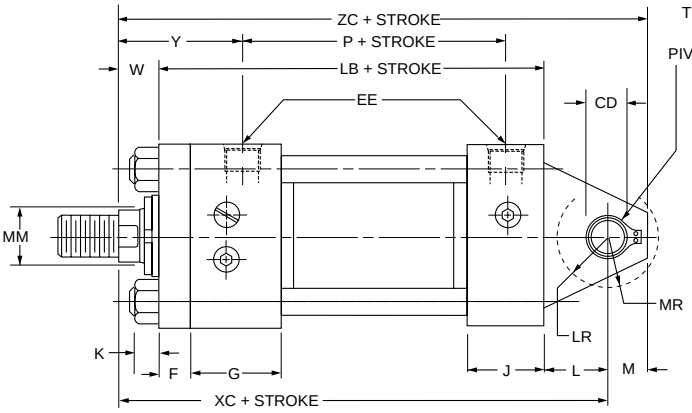


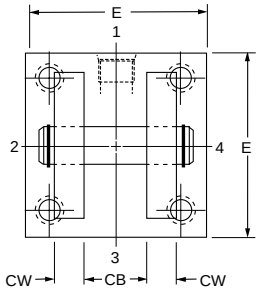


Cap Fixed Clevis Mounting Style BB
(NFPA Style MP1)



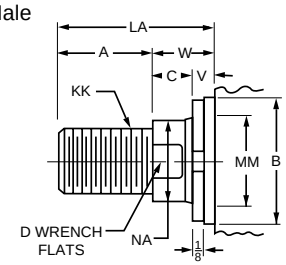
Tie rods thread into cap on all bore sizes.





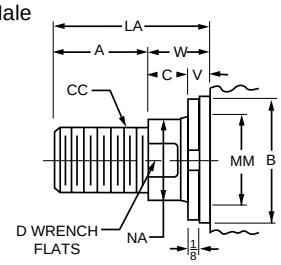
Rod End Dimensions — see table 2

Thread Style 4
(NFPA Style SM)
Small Male



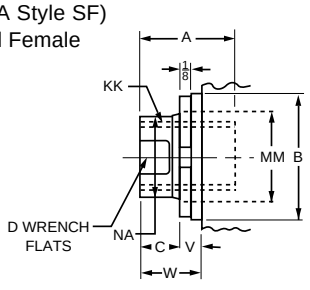
A high strength rod end stud is supplied on thread style 4 through 2" diameter rods and on thread style 8 through 1⅜" diameter rods. Larger sizes or special rod ends are cut threads. Style 4 rod ends are recommended where the workpiece is secured against the rod shoulder.

Thread Style 8
(NFPA Style IM)
Intermediate Male



When the workpiece is not shouldered, style 4 rod ends are recommended through 2" piston rod diameters and style 8 rod ends are recommended on larger diameters. Use style 9 for applications where female rod end threads are required. If rod end is not specified, style 4 will be supplied.

Thread Style 9
(NFPA Style SF)
Small Female



"Special" Thread Style 3

Special thread, extension, rod eye, blank, etc., are also available.

To order, specify "Style 3" and give desired dimensions for CC or KK, A and LA. If otherwise special, furnish dimensioned sketch.

For additional information – call your local Parker Cylinder Distributor.

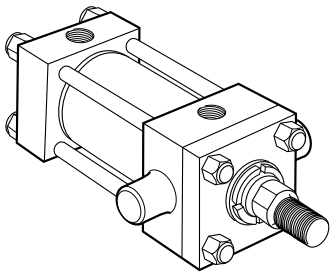
Caution: When using mounting styles CB and G, check clearance between mounting members and rod attachment or accessory. If necessary, specify longer rod extension to avoid interference with mounting members.

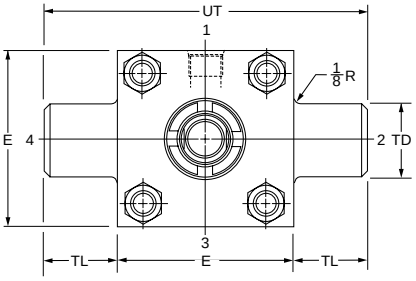
Table 3 — Envelope and Mounting Dimensions

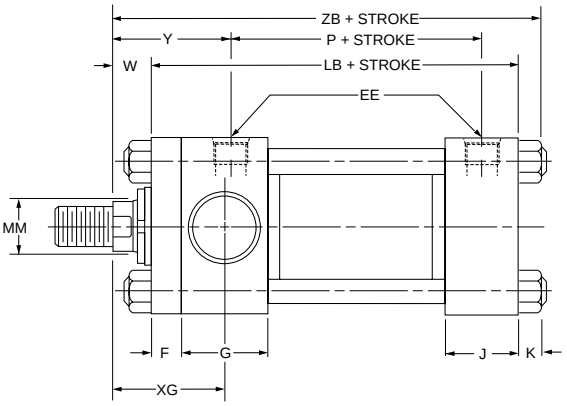
B

Series 2H
Heavy Duty Hydraulic Cylinders

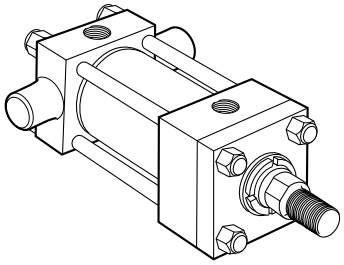
Head Trunnion Mounting
Style D
(NFPA Style MT1)

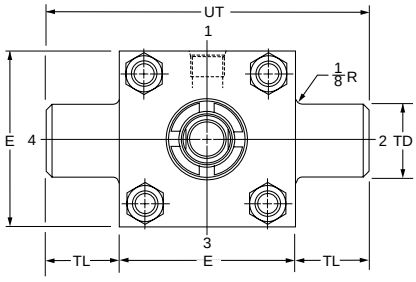


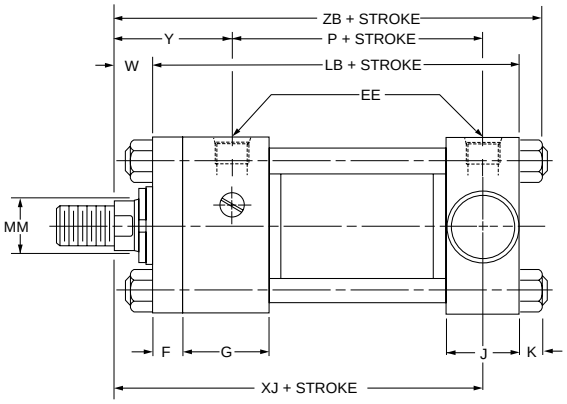




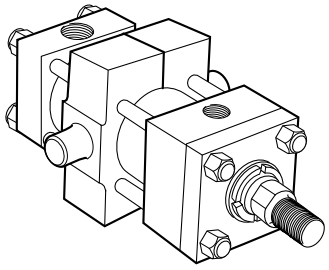
Cap Trunnion Mounting
Style DB
(NFPA Style MT2)

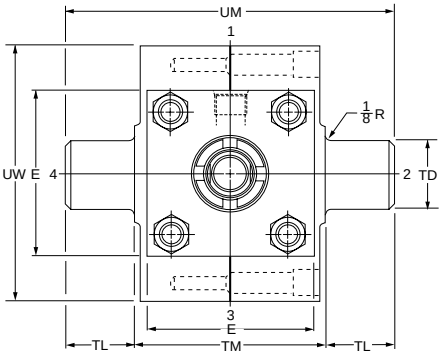


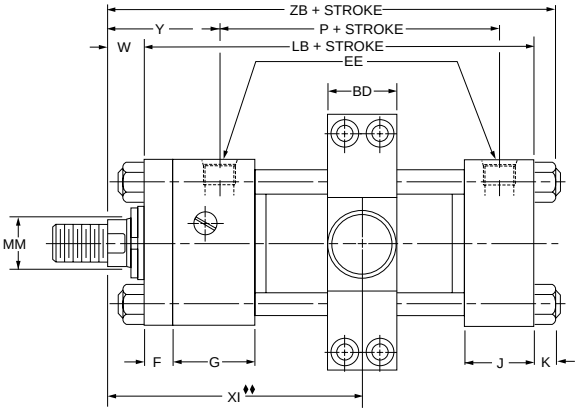




Intermediate Fixed Trunnion Mounting
Style DD
(NFPA Style MT4)

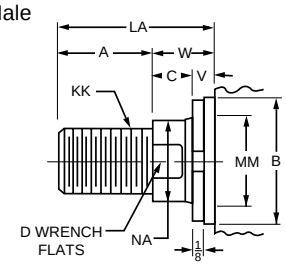






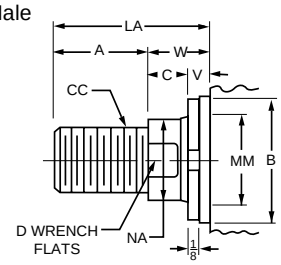
Rod End Dimensions — see table 2

Thread Style 4
(NFPA Style SM)
Small Male



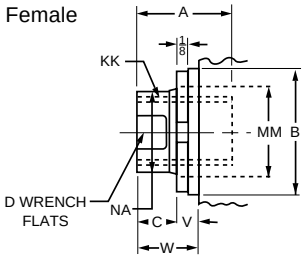
A high strength rod end stud is supplied on thread style 4 through 2" diameter rods and on thread style 8 through 1⅜" diameter rods. Larger sizes or special rod ends are cut threads. Style 4 rod ends are recommended where the workpiece is secured against the rod shoulder.

Thread Style 8
(NFPA Style IM)
Intermediate Male



When the workpiece is not shouldered, style 4 rod ends are recommended through 2" piston rod diameters and style 8 rod ends are recommended on larger diameters. Use style 9 for applications where female rod end threads are required. If rod end is not specified, style 4 will be supplied.

Thread Style 9
(NFPA Style SF)
Small Female



"Special" Thread Style 3

Special thread, extension, rod eye, blank, etc., are also available.

To order, specify "Style 3" and give desired dimensions for CC or KK, A and LA. If otherwise special, furnish dimensioned sketch.

For additional information – call your local Parker Cylinder Distributor.

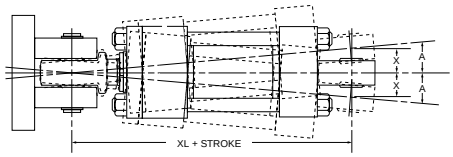
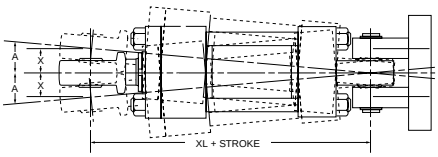
†Maximum operating pressure at 4:1 design factor is based on tensile strength of material. Pressure ratings are based on standard commercial bearing ratings.
Note: for additional dimensions see Series 2H Style BB mount.
Rod No. 1 is standard.
*Dimension "CD" is hole diameter.

Mounting Information

Head End Mounting



Cap End Mounting



Recommended maximum swivel angle on each side of the cylinder centerline.

Table 1

Bore	Head End Mounted Angle a	Head End Mounted Tan. of a	Cap End Mounted Angle a	Cap End Mounted Tan. of a
1½	2½	.035	2½	.035
2	2½½	.044	4½½	.079
2½	2½½	.044	4½½	.079
3¼	3½	.052	3½	.052
4	2½½	.044	3½	.052
5	3½	.052	3½	.052
6	3½	.052	3½	.052

Note: Dimension X is the maximum off center mounting of the cylinder. To determine dimension X for various stroke lengths multiply the distance between pivot pin holes by tangent of angle a. For extended position use X = XL times 2X stroke.

For additional information – call your local Parker Cylinder Distributor.

Parker offers a complete range of Cylinder Accessories to assure you of the greatest versatility in present or future cylinder applications. Accessories offered for the respective cylinder include the Rod Eye, Pivot Pin and Clevis Bracket. To select the proper part number for any desired accessory refer to the charts below.

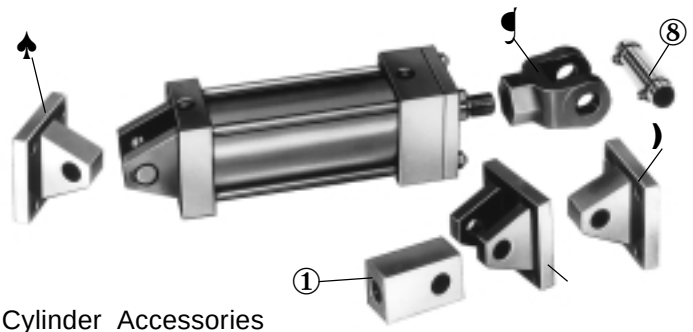
Series 2H
Heavy Duty Hydraulic Cylinders



Cylinder Accessories

Parker offers a complete range of cylinder accessories to assure you of greatest versatility in present or future cylinder applications.

Rod End Accessories

Accessories offered for the rod end of the cylinder include Rod Clevis, Eye Bracket, Knuckle, Clevis Bracket and Pivot Pin. To select the proper part number for any desired accessory, refer to Chart A below and look opposite the thread size of the rod end as indicated in the first column. The Pivot Pins, Eye Brackets and Clevis Brackets are listed opposite the thread size which their mating Knuckles or Clevises fit.

Chart A

Thread Size	Mating Parts			Mating Parts			Alignment Coupler

For alignment coupler dimensions, see section C.

*Cylinder accessory dimensions conform to NFPA recommended standard NFPA/T3.6.8 R1-1984, NFPA recommended standard fluid power systems — cylinder — dimensions for accessories for cataloged square head industrial types. Parker adopted this standard in April, 1985. Eye Brackets or Mounting Plates shipped before this date may have different dimensions and will not necessarily interchange with the NFPA standard. For dimensional information on older style Eye Brackets or Mounting Plates consult Drawing #144805 or previous issues of this catalog.

Accessory Load Capacity

The various accessories on this and the following pages have been load rated for your convenience. The load capacity in lbs., shown on the following page is the recommended maximum load for that accessory based on a 4:1 design factor in tension. (Pivot Pin is rated in shear.) Before specifying, compare the actual load or the tension (pull) force at maximum operating pressure of the cylinder with the load capacity of the accessory you plan to use. If load or pull force of cylinder exceeds load capacity of accessory, consult factory.

Chart B

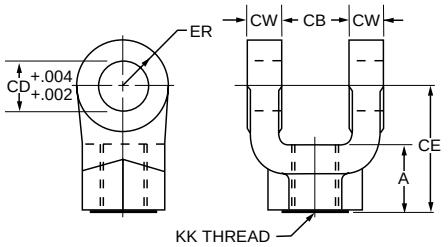
Mounting Plates

Mounting Plates for Style BB (clevis mounted) cylinders are offered. To select proper part number for your application, refer to Chart B, above right.

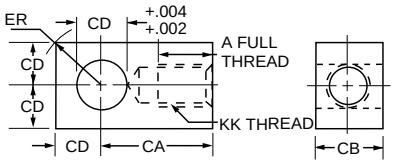
❩ Female Rod Clevis



②

Order to fit thread size.

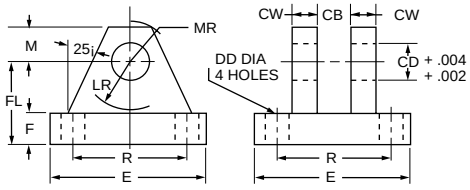
① Knuckle (Female Rod Eye)



②

Order to fit thread size.

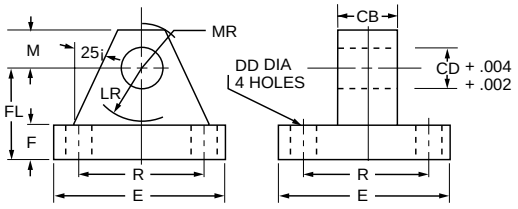
Clevis Bracket for Knuckle



②

Order to fit Knuckle.

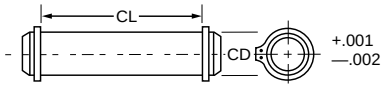
♠ Mounting Plate or ❩ Eye Bracket



②

1. When used to mate with the Rod Clevis, select from Chart A.
2. When used to mount the Style BB cylinders, select from the Mounting Plate Selection Table. See Chart B at lower left.

⑧ Pivot Pin



②

1. Pivot Pins are furnished with Clevis Mounted Cylinders as standard.
2. Pivot Pins are furnished with (2) Retainer Rings.
3. Pivot Pins must be ordered as separate item if to be used with Knuckles, Rod Clevises, or Clevis Brackets.

For additional information – call your local Parker Cylinder Distributor.

*Cylinder accessory dimensions conform to NFPA recommended standard NFPA/T3.6.8 R1-1984, NFPA recommended standard fluid power systems — cylinder — dimensions for accessories for cataloged square head industrial types. Parker adopted this standard in April, 1985. Eye Brackets or Mounting Plates shipped before this date may have different dimensions and will not necessarily interchange with the NFPA standard. For dimensional information on older style Eye Brackets or Mounting Plates consult Drawing #144805 or previous issues of this catalog.

⊖ See Accessory Load Capacity note on previous page.

•These sizes supplied with cotter pins.

†Includes Pivot Pin.

‡Consult appropriate cylinder rod end dimensions for compatibility.

For Cylinder Division Plant Locations – See Page II.

How to Order Series "2H" Cylinders

Data Required on All Cylinder Orders

When ordering Series "2H" cylinders, be sure to specify each of the following requirements:

Note: Duplicate cylinders can be ordered by giving the SERIAL NUMBER from the nameplate of the original cylinder. Factory records supply a quick, positive identification.

a) Bore

b) Mounting Style
Specify your choice of mounting style — as shown and dimensions in this catalog. If double rod is wanted, specify "with double rod".

c) Series Designation ("2H")

d) Length of Stroke

e) Piston Rod Diameter
Call out rod diameter or rod code number. In Series "2H" cylinders, standard rod diameters (Code No. 1) will be furnished if not otherwise specified, unless length of stroke makes the application questionable.

f) Piston Rod End Thread Style
Call out thread style number or specify dimensions. Thread style number 4 will be furnished if not otherwise specified.

g) Cushions (If required)
Specify "Cushion-head end", "Cushion-cap end" or "Cushion both ends" as required. If cylinder is to have a double rod and only one cushion is required, be sure to specify clearly which end of the cylinder is to be cushioned.

h) Alternate Lipseal® or Hi Load Piston (If desired)
Parker Lipseal® pistons are offered as an option at no extra cost in the Series "2H" cylinders. With this feature, zero leakage under static holding conditions is attained. Call out "with Lipseal® piston" if this type of piston is desired. If not specified, the ring type piston will be furnished.

i) Ports
Parker recommends SAE Straight Thread Ports for leak-proof port connections on Series "2H" hydraulic cylinders.

j) Fluid Medium
Series "2H" hydraulic cylinders are equipped with seals for use with hydraulic oil. If other than hydraulic oil will be used, specify class of fluid (see Catalog section C).

Additional data is required on orders for cylinders with special modifications. For further information, consult factory.

Class 1 Seals

Class 1 seals are the seals provided as standard in a cylinder assembly unless otherwise specified. For further information on fluid compatibility on operating limitations of all compounds, see section C.

For the 2H series cylinders the following make-up Class 1 Seals:
Primary Piston Rod Seal – Enhanced Polyurethane
Piston Rod Wiper – Nitrile
Piston Seals – Cast Iron Rings
Option – Nitrile lipseals with polymyte back-up washers
Option – Hi Load. Filled P.T.F.E. seals with a nitrile expander.
O-Rings – Nitrile (nitrile back-up washer when used)

Service Policy

On cylinders returned to the factory for repairs, it is standard policy for the Cylinder Division to make such part replacements as will put the cylinder in as good as new condition. Should the condition of the returned cylinder be such that expenses for repair would exceed the costs of a new one, you will be notified.

Address all correspondence and make shipments to, Service Department at your nearest regional plant listed in the pages of this catalog.

Certified Dimensions

Parker Cylinder Division guarantees that all cylinders ordered from this catalog will be built to dimensions shown. All dimensions are certified to be correct, and thus it is not necessary to request certified drawings.

Warranty

Seller warrants the goods sold hereunder to be free from defects in material and workmanship. This warranty shall terminate eighteen months after date of shipment from Seller's plant and claims not made in writing within such period are waived.

The above warranty does not extend to goods damaged after date of shipment from Seller's plant where the damage is not directly due to a defect in material or workmanship, nor does it apply to goods altered or repaired by anyone other than Seller's authorized employees, nor to goods furnished by Buyer or acquired at Buyer's request and/or to Buyer's specifications.

If the goods are in accordance with or in reference to an engineering drawing specified by or furnished to the customer, the specifications and information on the drawing shall be applicable in determining such correct use, operation and application.

When claiming a breach of warranty, Buyer must notify Seller promptly whereupon Seller will either examine the goods at their site, or issue shipping instructions for return to Seller (transportation costs prepaid by Buyer). When any goods sold hereunder are proved as not warranted, Seller's sole obligation under this warranty shall be to repair or replace the goods, at its option, without charge to Buyer.

The above warranty comprises Seller's sole and entire warranty obligation and liability to Buyer, its customers and assigns in connection with goods sold hereunder. All other warranties, express or implied, including but not limited to, warranties of merchantability and fitness, are expressly excluded.

For additional information – call your local Parker Cylinder Distributor.

Series "2H" Model Numbers – How to Develop Them – How to "Decode" Them

Parker Series 2H cylinders can be completely and accurately described by a model number consisting of coded symbols. For single rod cylinders a maximum of 17 places for digits and letters are used in a prescribed sequence to produce a model number. Only nine places are needed to completely describe a standard noncushioned Series 2H cylinder. To develop a model number, select only those symbols that represent the cylinder required, and place them in the sequence indicated below.

Note: Page numbers with a letter prefix, ie: C77, are located in section C of this catalog.

Feature	Description	Page No.	Symbol
Bore*	Specify in inches		
Cushion-Head	Used **only** if cushion required	C94,42 & 43	C
Double-Rod	Used **only** if double-rod cylinder is required	58	K

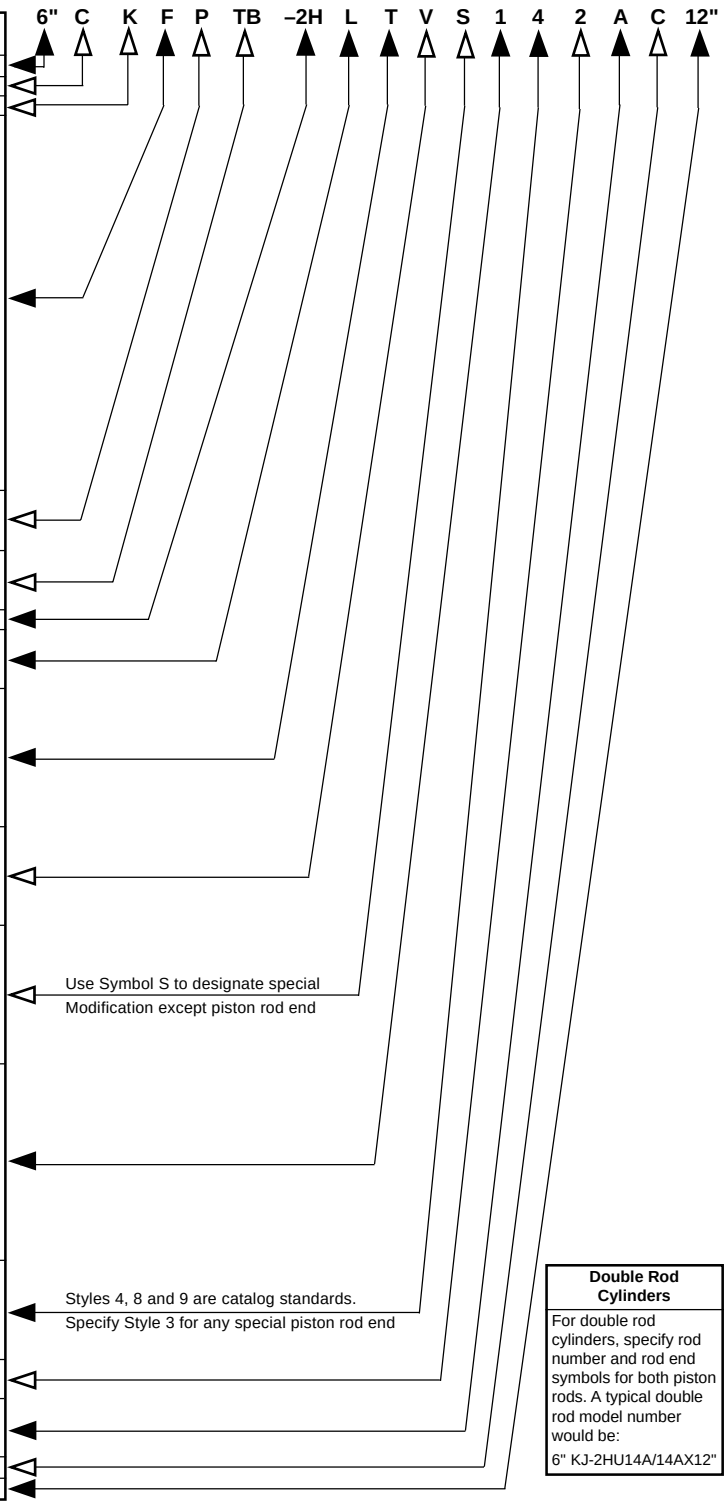
Piston Rod* Threads	UNF Standard	C92	A
	BSF (British Fine)	C92	W
	Metric	C92	M
Cushion-Cap	Used **only** if cushion required	C94, 42 & 43	C
Stroke*	Specify in inches	C93	–



Double Rod Cylinders

For double rod cylinders, specify rod number and rod end symbols for both piston rods. A typical double rod model number would be:

6" KJ-2HU14A/14AX12"

*Required for Basic Cylinder Model Number

Dark Arrows Indicate Basic Minimum Model Number †Cylinders with these mounting styles should have a minimum stroke length equal to or greater than their bore size.

PNEUTECH ROUSSEAU INC.
GARANTIE

Le matériel et la main d'oeuvre sont garantie pour une période de trois (3) mois à partir de la date de démarrage ou six (6) mois après la date de livraison selon la première échéance.

Si durant la période de garantie, un vice de construction ou d'exécution est décelé, la réparation ou le remplacement se fera aux frais de Pneutech Rousseau Inc., ci-après appllée "La Compagnie", et ce choix de la Compagnie.

La garantie devant être accordée par Pneutech Rousseau Inc. prévaut expressément sur toute autre garantie, expresse ou tacite, y compris toute garantie portant sur la qualité marchande des équipements ou leur conformtié pour un usage déterminé.

Les dédommagements au titre de la présente garantie se limitent expressément à la fourniture des pièces et de services au conditions spécifiées, et toutes réclamations pour toutes autres pertes et dommages (y compris mais sans s`y limiter, les pertes d'ordre économique ou moral, ou encore tous autres dommages directs, indirects, spéciaux previsibles ou imprévisibles) sont expressément exclus.

La présente garantie ne couvrira pas les coûts associés à ce qui suit :
- Tous les frais relatifs au transport du produit ou de l`équipement au site;
- Les frais de déplacement du personnel pour réparation des produit sur le terrain;
- Les heures suppplémentairs ou autre frais de main d'oeuvre exceptionnels;
- Les frais de transport des pièces en sus des frais ordinaires et d'usage;
- Tous les frais reliés à la recherche d'un défaut de rendement du produit relié à son utilisation sauf si ledit défaut est imputable à un vice de matière ou fabrication.

La garantie cesse de plein droit si l'acheteur a effectué des modifications, adjonctions ou des réparation sur les équipements de sa propre initiative et sans notre accord autorisé.

GARANTIE FORMULAIRE 1
22 Février 1989

PNEUTECH ROUSSEAU INC.
WARRANTY

Equipment and labor are guaranteed for a period of three (3) months from date of start up or six (6) months from date of shipment whichever occurs the first.

If a defect in material or workmanship is found during the warranty period, it will be repaired or replaced at Pneutech Rousseau Inc. option and cost. This warranty is expressly in lieu of any other warranty, express or implied, including any warranty or merchantability of the equipment or fitness for a particular purpose. Remedies under this warranty are limited to repair or replacement as specified above and any claims for other loss or damages of any kind (including, without limitation, loss from the use of the equipment or failure of the equipment to operate for any period of time, economic loss or other direct, indirect or consequential damages) are expressly excluded.

This warranty shall not cover the cost of the following:
- All related costs for transporting the product or the equipment to site;
- Travel expenses of our personnel for field repair of products;
- Premium or overtime labor cost;
- Parts shipping charges and other expenses other than those which are usual and customary;
- All costs to investigate performance complaints unless the problem is caused by a defect covered by this warranty.

This warranty legally ceases if the buyer has, under his own initiative and without our explicit consent made any modification, addition or repairs on the equipment.

FREEZE CO. SYSTEMS LTD.

AIR COOLED CHILLER

MANUFACTURER: FREEZE CO SYSTEMS LTD
OPERATION & MAINTENANCE MANUAL

Manufacturers of Industrial Process Cooling Systems
Freeze Co Systems, Ltd. • 2100 Steeles Ave. • Brampton, Ontario • L6T 1A7
Phone: (905) 789-9988 • Fax: (905) 789-9989 • www.freezeco.com

GNA ALUTECH INC.
4.5 TON AIR COOLED CHILLER
SERIAL # 001102717
MODEL# FCAC-007.5-2-P

SEQUENCE OF OPERATIONS

Hot water (10% EG) coming from the secondary heat exchanger is entering Evaporator at 65°F and leaving at 55°F to the reservoir. Chiller pump will circulate cold water (10% EG) through 3 ways modulating valve to secondary heat exchanger to cool Hydraulic oil. Three ways valve will modulate water flow to maintain 100°F hydraulic oil temperature.

SUMMARY OF PERFORMANCE

Technical	
Model Number of Chiller	FCAC-007.5-2-P
Quantity of chillers	1
Fluid in	95ºF
Fluid out	85ºF
Capacity	4.5 TR
Refrigerant used	R134 a
Main Power	460V-3-60
Ambient Condition	131ºF
Type of Unit	Air Cooled
Type of condenser	Air Cooled
Type of Fan	Axial Flow
Temperature Control	Johnson Controls
Fluid to be cooled	Water
Unit casing	Epoxy coated
Commercial	
1. Freight	Prepay & add
2. Parts Warranty	1 year Parts
3. Unit Serial Number	001102717
5. Date of Shipment	
6. Date of Start Up	

CHILLER DESCRIPTION

Semi-hermetic reciprocating compressor

Semi-hermetic reciprocating compressors with two-step of capacity control by cylinder un-loading ideal for energy saving at low load conditions. It has an advantage over hot gas by-pass capacity control where capacity control is limited to 80% of capacity with negligible energy saving whereas with reciprocating compressor cylinder un-loading compressor motor consumes approximately 50% less power and capacity reduces to 50%. Chances of evaporator freezing reduce because refrigerant mass flow to evaporator reduces when compressor unloads.

- Exclusive design of reciprocating compressors.
- High efficiency motors.
- Equipped with protection devices.
- High efficiency UL approved compressor
- Cylinder unloading for capacity control.
- Lightweight

Brazed plate evaporator

Brazed plate heat exchangers are highly efficient in refrigerant service. Their small size, low refrigerant charge and superior efficiency make them ideal for the particular application. The brazed plate heat exchanger is constructed entirely of corrosion resistant materials. The design of the plates creates a high turbulence resulting in outstanding heat transfer. The heat transfer plates and the connections are made from highly resistant 316SS. Fouling of the heat transfer surfaces of brazed plate heat exchangers is extraordinarily low. This is a result of uniform product distribution, constant velocity profile and smooth plate surfaces. The result is many years of dependable service.

- Rated for 450 PSI operating pressure
- Extremely compact design
- Maximum material efficiency due no “dead zone”
- Enhanced surface.
- Operates efficiently
- 316 SS copper brazed plate
- True counter-current flow allows close temperature approach.
- Fluid connection for quick disassembly for service
- 2’’ Armaflex insulation

Air-cooled condenser

Condensing coils are constructed using high efficiency aluminum fins mechanically bonded to seamless copper tubing. All headers and connections are copper. Coils are factory leak tested at 400 psig, dehydrated, sealed and braced to seamless copper headers. Direct drive, permanently lubricated fan motors require no belts, no pulleys or mandrels thus eliminating lubrication, and periodic maintenance requirements. Fan motors are factory wired and interlocked with the compressor in the weather resistant control panel. Heavy grade steel wire fan guards are weather coated for corrosion protection.

- Rated for 400 PSI operating pressure
- Extremely efficient design
- Maximum material efficiency due no “dead zone”
- Large hold up volume-uses large surface of heat transfer (refrigerant) medium.
- Copper tube aluminum fins construction.
- Can operate on high working pressure.
- Propeller fans
- TEFC high efficiency fan motor
- Fan Cycling control to maintain condensing temperature.

Refrigeration components

- High quality components are employed
- Access to all components is made easy for maintenance purpose therefore shutdown to entire is not required for replacing defective part.
- Brazed plate DX type evaporator
- Relief valve
- Electronic TX valve with sensor and transducer to control superheat
- High and low pressure Transducers
- Liquid line serviceable drier core
- Liquid line moisture sight glass
- Suction and discharge service valves
- ACR refrigeration pipes.
- Liquid line service valve
- Hot gas bypass valve

Modular Electronic Control Systems

A350P SERIES: TEMPERATURE MODULAR CONTROL

Description

The A350P is an electronic, proportional plus integral temperature control. This control has an integration feature that forces the control point to match the setpoint. Over time, the A350P will control the heating/cooling equipment to balance the system load at the control setpoint.
As are all System 350™ products, the A350P control is housed in a NEMA 1, high-impact plastic enclosure. The modular design provides easy, plug-together connections for quick installation and future expandability.

Features

- Field-selectable proportional only or proportional plus integral control
- Plug-together connectors and 35 mm DIN rail mounting eliminate wiring between models and reduce installation costs
- Ten segment LED displays percent of output signal
- Field-selectable reverse or direct-acting mode
- Minimum output adjustable from 0 to 60%
- Two models cover a wide setpoint range of -30 to 250°F (-35 to 121°C

High Pressure Control – is connected to the high side of the refrigeration system and automatically shutdown the system when discharge pressure exceeds control setting . High pressure indicating light will show the high pressure fault. This control must be manually reset once the problem has been rectified.

Low Pressure Control – serves two functions. It is connected to the low side of the refrigeration system and acts as a safety devices to prevent the compressor from running in case of excessive refrigerant shortage or abnormally low suction pressure. It is also used for system pump down control.

Anti-Short Cycle Timer – prevents the compressor from cycling on and off too frequently which causes premature wear to the compressor components. Factory set at 5 minutes.

Chilled Water Flow Switch – is a safety device which prevents the unit from operating with little or no water flows through the evaporator / heat exchanger.

Motor Overload Protection – All motors are equipped with either internal or external, thermal motor overload protection. External overloads are factory set to full load amperage of the motors.

Crankcase Heater – is provided for extra protection against refrigeration vapor immigration to the compressor crankcase during off cycles. The heater heats the oil at a temperature high enough so that any liquid refrigerant in the crankcase will evaporate and create pressure sufficient to prevent further migration to the compressor. If liquid refrigerant exists in the compressor on startup the reduction in suction pressure will cause the liquid to evaporate thus causing oil foaming. This oil / refrigerant mixture may enter into the compressor cylinders causing "slugging". The refrigerant also dilutes the oil and reduces effective lubrication.

Control Thermostat – The unit temperature controller monitors the process return water temperature and cycles the refrigeration system to maintain accurate process water temperature.

Chiller pumping station

Pumps employed in Freeze Co. chillers are specially designed for industrial process cooling applications. Centrifugal pumps are fitted with bronze impellers (optional stainless steel) and mechanical seals. End suction pumps are driven by premium efficiency totally enclosed motors. Refer owner's manual for operation instructions.

- Process Pump
- Bronze impellers
- Mechanical seal
- Low noise 3450 RPM pumps
- Pre piped skid
- Isolating valves, and check valves included
- Insulated Pre piped assembly
- Fluid connection for quick disassembly for service
- Insulated 304 stainless steel reservoir
- Fill and drain port
- Low level switch
- Three ways bypass valve
- Secondary heat exchanger

Pump Motors

General Specifications:

- Use with close-coupled pumps having NEMA JM mounting dimensions
- Continuous Duty service
- 1.15 Service Factor rating
- Mechanically locked bearing – shaft-end limits axial shaft movement
- UL and C.S.A recognized
- Quiet operation through “Super Hush” flow-through ventilation system
- Class F insulation

Ratings:

ODP	Rigid base	3450 RPM	230/460V	2 - 50 HP
ODP	Rigid base	1740 RPM	230/460V	1 - 40 HP
TEFC	Rigid base	3450 RPM	230/460V	1.5 - 40 HP
TEFC	Rigid base	1740 RPM	230/460V	1 - 40 HP
Washguard Duty	Rigid base	3450 RPM	230/460V	1.5 - 15 HP
Washguard Duty	Rigid base	1740 RPM	230/460V	1 - 10 HP

Steel structure and cabinet

- Chiller and condenser package is assembled on a 4''X 4'' X 0.25'' Steel beams.
- Steel frame is coated with high quality corrosion resistance paint. (powder coating as an option)
- Casing is made out of powder coated white aluminum sheets

INSTALLATION

Shipment

All Freeze Co air-cooled portable chillers are shipped completely assembled fully charged with refrigerant and oil.

Receiving

Immediately after receiving the unit at site, it must be inspected carefully for shipment damage(s). Should any damage be found, it must be reported to the transporter and Freeze Co Systems Ltd.

Unit Placement

Unit is designed for outdoor use with adequate weather protection and under an ambient temperature of 131 °F. Base or foundation is not required if the selected unit location is level and strong enough to support the unit's operating weight. Generally, foundation should support at least 150% of the operating weight of unit.

Unobstructed flow of condenser air is essential to maintain chillers' capacity and operating efficiency. When determining unit placement, careful consideration must be given to assuring a sufficient flow of air across the condenser heat transfer surface. Two detrimental conditions are possible and must be avoided, warm air circulation and coil starvation.

Warm air re-circulation occurs when discharge air from the condenser fans is recycled back to the condenser coil inlet. Coil starvation, occurs when free airflow to the condenser is restricted.

Condenser coils and fan discharge must be kept free of snow or other obstructions to permit adequate airflow for satisfactory unit operation. Debris, trash, supplies etc. should not be allowed to accumulate in the vicinity of the air-cooled chillers'. Supply air movement may draw debris into the condenser coil, blocking spaces between coil fins and causing coil starvation.

Both warm air circulation and coil starvation cause reductions in unit efficiency and capacity because of the higher head pressures. Crosswinds those perpendicular to the condenser, tend to aid efficient operation in warmer ambient conditions, however they tend to be detrimental to operation in lower ambient conditions.

Adequate clearance for evaporator and compressor servicing should be provided. Recommended minimum space envelope is 3 feet of free area on either side of the unit for maintenance. (Service clearance must allow for compressor and evaporator removal)
Unit should be located as close to pump station as conveniently possible to avoid any pressure drop and unnecessary excess piping.

Fluid Connections

Water connection should be provided as shown in the associated drawing. Check for labels on the unit for process supply and return, city water, overflow and drain connections. To reduce heat loss and prevent condensation, insulation should be applied.

Fluid Treatment

Dirt, scale, products of corrosion and other foreign material in the fluid will adversely affect heat transfer between the fluid and system components. Foreign matter in the chilled fluid system can also increase pressure drop and, consequently, reduce fluid flow. Proper fluid treatment must be determined locally and depends on the type of system and fluid characteristics. It is recommended that the services of a qualified fluid treatment specialist, familiar with local fluid condition, to assist in the establishment of a proper fluid treatment program. Freeze Co Systems Ltd. assumes no responsibility for equipment failures, which are the result of untreated or improperly treated fluid.

Refrigerant Charge

See manufacturer name plate.

START-UP PROCEDURE

Check List

General information

Job Name: _____

Location: _____

City _____

Contact Name: _____

Contact Phone: _____

Installing Contractor: _____

General Contractor: _____

Mechanical Contractor: _____

Start Up Contractor: _____

Start Up Technician Name:_____

Date of Startup: _____

Equipment chiller is serving:

Manufacturer:_____

Type of Machine(s):_____

Model of Machine(s):_____

Chiller Model: _____

Chiller Serial Number: _____

Visual inspection:

1. Installation correctness:

a. Pipe sizes to chiller: _____

b. Insulated? _____

c. Distance, each way to equipment: _____

d. Approx. number of elbows each line:_____

e. Height (up) (down) to equipment: _____

2. List any devices installed in line between the chiller and the equipment and their pressure drops, if known _____

3. Chiller foundation:
a. Roof mount? _____

b. Ground pad? _____

c. Indoor mechanical room?:_____

d. Outdoor other? _____

4. Electrical Service:
a. Fused disconnect?:_____

b. Non-fused disconnect?:_____

c. Circuit breaker rating:_____amps

d. Rated power supply:_____volts_____ph

e. Frequency of supply:_____

f. Check the power supply voltage to ground and record each leg (phase) below:

L-1:_____ L-2:_____ L-3:_____

****Place the high leg on the center L-2 terminal inside the chiller cabinet on the distribution block or disconnect.**

WARNING
Disconnect all electrical power sources before making wiring connections to the unit. Failure to do so may result in injury or death due to electrical shock.

Inspect all wiring connections. Connections should be tight and clean. Electrical routing should be as indicated on the wiring diagram provided on or with the unit.

- Measure supply voltage and voltage phase balance at the compressor terminals. Voltage readings should be within the range given on the motor nameplate (usually 10 percent). Maximum voltage phase imbalance is 2 percent.
- Measure meg-ohm-winding resistance.
- Energize crankcase heaters by keeping the compressor switch off, and turning the control power switch on. After 10 minutes, feel the compressor to verify heater operation.
- The crankcase heaters must be energized for at least eight hours before unit start-up.

CAUTION: Compressor crankcase heaters must be energized for at least 8 hours before normal operation of the unit. Failure to do so may result in severe damage to the compressor due to the presence of liquid refrigerant in the compressor.

- Check compressors oil level. Oil should be visible in the sight glass.
- Open compressor service discharge and suction valves and receiver inlet outlet valves.
- Open the evaporator process fluid briefly to check the entire circuit for leaks or blocked fluid flow, by starting the pumps manually. The system should already been flushed.
- Stop the pump immediately after the inspection.
- Check the operation of solenoid valves, contactors, starters and control relays.
- Be sure all sensing bulbs are securely installed in their wells with heat transfer compound.
- Set controls at their proper settings.
- Energize heat tape for all exposed piping.
- Open isolating valves.
- Adjust the flow switch if required

Voltage Imbalance

Voltage imbalance must not exceed 2 percent. Voltage imbalance is defined as 100 times the maximum deviation of the three phase voltages from the average, regardless of sign, divided by the average voltage. For example, if the three measured voltages were 221, 230 and 227 the average voltage would be 226 and the percent of voltage imbalance would be:

$$\frac{100 \times (226 - 221)}{226} = 2.2\%$$

In this case, 2.2 percent of voltage imbalance is not acceptable. Check the voltage readings at the disconnect switch to determine if the imbalance is present in the incoming power lines. If the imbalance is due to problems within the unit, check the unit electrical wiring connections.
Compressor Meg-ohm Resistance

Measure the voltage between each set of phases:
L-1 to L-2:_____
L-2 to L-3:_____
L-1 to L-3:_____
g. Does the supply voltage comply with the minimum rating on the chiller name plate
If it does not, call FreezeCo Technical Support immediately for instructions before turning on the power.

To determine the insulation between each compressor motors winding and earth:

1. Open the units electrical disconnect switch.
2. Open compressor motor circuit breaker (fuse).
3. Using a 500-volt meg-ohm meters (motor megger), determine the resistance between each compressor motor terminal and earth. Place one of the test lead against bare metal, such as the suction or discharge line, and the other lead against one of the motor terminals.
4. Repeat step 3 for the other two terminals.

The readings on all terminal-ground combinations should be at least 2.0 meg-ohms, at 70 F.

CAUTION: Do not Meg or apply power to the windings of the compressor motor while it is in a vacuum. Damage to the motor windings may result.

Check Control Settings

Voltage drops on control voltage are serious matters and must be found before problems occur.

a. Check all connections inside the chiller control panel for tightness and possible problems that may have occurred during shipment. Ensure all components are securely mounted.
b. Voltage at compressor contactor coil _____
c. Voltage at pump contactor coil _____
Are there any field supplied wiring junction boxes located between the chiller and any remote panels? _____
Are there any splices made in the junction boxes? _____
Are there any customer supplied devices connected to the chiller wiring? _____ What? _____
Are there any FreezeCo remote devices connected to the chiller wiring? _____ What? _____
If voltage drops are being detected, call FreezeCo service department before operating the system.

Set all adjustable controls to their required settings. Design temperatures can be determined from the original sales order and must be known for the setting of controls.

Expansion Valve Superheat Adjustment

The importance of proper suction gas superheat cannot be over-emphasized. Accurate superheat measurements should be taken with other trouble analysis procedures to monitor refrigerant flow, coil efficiency and compressor protection. The recommended setting range for superheat on Freeze Co. System's equipment is 10°F

Flushing the water lines

Flushing the system is the installing contractor's responsibility. If the water lines have not been properly flushed clean, inform the site supervisor, owner, or mechanical contractor representative. Please call FreezeCo, also. Flushing procedures are outlined in the chiller manual.
Water lines have been flushed and cleaned _____.
Note: While flushing under no circumstances water should be circulated through evaporator and condenser. Chiller pump on the package shall never be utilized to flush system piping

Filling the system with glycol

In most instances the installing contractor is responsible for charging glycol into the system. If not charged, please do so according to the following instructions.
1. First, mix the concentrate of propylene glycol in a tank or drum for transfer into the chiller tank. Mixing externally before filling will prevent clogging of the chiller piping and pump suction with the heavy concentrate.
2. Fill the tank through the manual fill port on the cabinet and fill to near the top. Stop so the level can be seen.

Installation instructions

WARNING!! DO NOT ATTEMPT TO START THE UNIT WITHOUT FREEZE CO REPRESENTATIVES ON SITE. ONLY CARRY OUT THE FOLLOWING INSTALLATION:

1. Inspect the location desired for unit installation and verify adequate service access clearance
2. Do not switch unit on without making a complete visual check of unit for damage(s) sustained during installation
3. Inspect all piping connections visually for poor fit
4. Remove and discard shipping materials.(cartons, wooden skid)
5. Place unit on pad and level unit and secure unit
6. bring in 208/3/60 main power to unit disconnect as per attached electrical drawings
7. Refer drawings and use conductor size as per local codes
8. Install suitable fittings and conduits for power connection
9. Complete pump interlocks as per drawings if required
10. All wiring must comply with local codes
11. A heat load to the chiller must be available for start-up
12. Complete external fluid piping and test for leaks
13. Air vents to be provided for venting air at the highest points
14. Provide pressure gauges and shut off valves as required
15. Install drain point at appropriate location
16. Flush all field piping before making final connection to the unit
17. Install strainer in the water circuit
18. Charge the fluid system

NOTE: AT LEAST 2 WEEKS NOTICE IS REQUIRED FOR START UP. ALL WORKS REQUIRED TO BE CARRIED OUT PRIOR TO OUR TECHNICIANS AT SITE SUCH AS INCOMING POWER AND FLUID CIRCUIT MUST BE COMPLETED.

Quick Start-up

- Inspect all piping connections visually for poor fit.
- Check to ensure that all pipe supports are secure.
- Check all electrical main and control connections to ensure that they are tight.
- Supply voltage should correspond to that indicated on cooling system nameplate.
- Control settings are factory set and don't require any alteration.
- Open receiver service valves
- Turn main disconnects switch on, leaving control and compressor switch off.
- A minimum of 8 Hours (Recommended 24 hours) compressor oil warm up required before start-up. This allows the compressor crankcase heater to evaporate the refrigerant in the crankcase oil.
- Check process pump rotation by starting manually.
- A heat load to the chiller must be available for start-up
- Turn control and compressor and process pump switches, "on". Process pump should start. After 5-minutes delay the compressor will start.
- Check for proper direction of rotation of the condenser fan.
- Allow unit to run continuously for ten minutes under full load conditions. Check sight glass for adequate refrigerant charge and condition of moisture indicator (yellow or green dot).
- Check total piping system and pump seals for water leaks.
- The control thermostat should be set at desired temperature. The unit should be observed for abnormalities under operating conditions for a minimum of two hours.
- Record all the readings on start up log sheet. (enclosed in this brochure)
- When shutting down the unit, turn control switch to "off", leaving main disconnect "on" to keep power for crankcase heater

MAINTENANCE

Periodic Maintenance

The start-up log, supplied with each unit should be used to record the periodic maintenance and inspection observations.

Maintenance Inspections

If the unit does not perform properly during these inspections, consult the Troubleshooting section for possible cause and recommended procedures.

CAUTION: The refrigeration system of this equipment is pressurized. Use proper service procedures to relieve pressure before servicing.

CAUTION: The chilled fluid system of this equipment may be pressurized. Use proper service procedures to relieve pressure before servicing.

CAUTION: Turn off unit and disconnect before servicing unit electrical components. Failure to do so may result in injury or death from electrical shock.

Maintenance Procedures

Once a week

1. Check liquid line sight glasses. Flow should appear smooth with no evidence of gas bubbles. If gas bubbles appear, a refrigerant shortage is indicated. Check for refrigerant leak, repair and add refrigerant.
2. Inspect entire system for any unusual conditions such as noisy compressor, loose access panels, pipe or joint leakage or chattering contactors.

Once a month

1. Perform monthly inspections.
2. Start unit and observe operating pressures. If pressures are above or below normal, see "Trouble Analysis" section.
3. Check fan alignment and clean condenser fins from any foreign particle or dust.

Once a year

1. Perform the weekly and monthly inspection.
2. Clean the chilled brazed plate heat exchanger.
3. Inspect contacts of motors contactors and system controls.
4. Check setting and functions of each system control.
5. Inspect system for leaks. Also inspect all valves, pumps and related equipment for proper operation.

6. Remove rust and corrosion from any surfaces.
7. Inspect expansion valve sensing bulb for cleanliness, proper installation and insulation.
8. Perform an oil analysis to determine the acidity of the compressor oil and record the results.

WARNING/CAUTION: The oil analysis procedure must be performed by a qualified service technician. Incorrect interpretation or analysis results can cause damage to the unit. The use of improper analysis procedures can cause hazardous conditions that may result in injury to service personnel

Compressor motor

Open motor windings

1. Open the master disconnects switch.
2. Remove compressor fuses.
3. Touch the leads of an ohmmeter to each combination of two terminals. In additions to continuity test make sure that this correlation is satisfied : SR = SC + RC

Earth motor windings

1. Turn off master disconnect switch.
2. Remove compressor fuses.
3. Place one test lead of an insulation tester or meg-ohmmeter against bare metal (earth).
4. Touch the other lead to each motor terminal, in turn. The readings obtained should exceed 2 meg-ohms. If any reading is below the range, an earth winding is indicated. Do not start the compressor if the reading is below 2 meg-ohms.

Voltage

Check the voltage across the compressor terminals, when the system is operating.

1. Voltage not to exceed plus or minus 10% of compressor motor rating (voltage utilization range).
2. Voltage unbalance between phases not to exceed 2%

Contactor

Inspect the contacts. If they appear pitted or burned, replace the contacts or contactor.Using an ohmmeter, test continuity of the contactor holding coil. If the coil does not test continuous, replace it.

Liquid line solenoid valve, drier

Restricted drier is indicated by:

1. Low suction pressure.
2. Temperature drops across valve or drier.
3. Frosting of valve or drier in severe cases.

If these symptoms are observed, Change drier core

Low Side Repairs

If the drier, solenoid valve, expansion valve or low side piping requires repair:

1. Pump down the system. Allow temperature of all parts to stabilize. This will prevent moisture from condensing on inside surfaces of open system.
2. When a new part is being installed, make the brazed joint nearest to the liquid line valve first. With the joint made, crack the liquid line valve for an instant to purge the air from the part. When the air has been purged, complete the remaining joint.
3. It should be noted that this method is applicable only after minor repairs. Should any major work, such as opening the chiller or compressor, be necessary, it is recommended that the entire low side of the system be evacuated.

Condenser Relief Valve

A relief valve is located at compressor refrigeration discharge line for air-cooled condenser and brazed plate water cooled condenser. This valve will relieve the pressure at a preset valve, releasing the pressure in the circuit. Should this happen, make sure that the value is closed and recharge the system.

High side repairs

If the condenser, compressor or high side piping and fittings require repair, remove the refrigerant charge from the system. After the repairs have been completed, leak test, evacuate and charge.

TROUBLE SHOOTING AND FAULT DIAGNOSTICS

COMPRESSOR FAILS TO START

POSSIBLE CAUSE	SYMPTOMS	RECOMMENDED ACTION
Power failure	Electric circuit test shows no voltage on in coming terminal block.	Check for blown fuses and open disconnects.
Breaker tripped	Electric circuit shows no voltage on motor side of breaker.	Reset breaker. Check load on compressor motor.
Low Voltage	Voltmeter indicates insufficient Voltage at main.	Call power company.
Burned- out motor	Full voltage at motor terminal but motor will not run.	Replace.
Inoperative motor starter	Test for burned-out holding coil or broken contacts.	Repair or replace.
Open control circuit	Motor starter holding coil is not energized.	Locate open control and determine cause. See individual control instructions
Frozen compressor due to locked or damaged mechanism	Compressor will not operate.	Repair compressor.
Discharge pressure above cut-out setting of high pressure cut-out switch	Open contacts on high pressure switch. Discharge pressure above cut-in setting.	See complaint " Discharge pressure too high ".
Overload contacts open	Starter will not pull in.	Reset overload and determine cause.
Flow switch contacts open	System will not start.	Restore water flow, check flow switch operation.
Faulty temperature controller	Control circuit will not energize.	Check control set points, contacts.

COMPRESSOR SHORT CYCLES

POSSIBLE CAUSE	SYMPTOMS	RECOMMENDED ACTION
Intermittent contact in Electrical control circuit	Normal operation except too frequent Stopping and starting.	Repair or replace faulty control.
Low pressure controller Differential set too close	Normal operation except too frequent Stopping and starting.	Reset differential in accordance with proper job conditions.
Leaky liquid line solenoid valve	Valve may hiss when closed. Also temperature change in refrigerant line through valve.	Repair or replace.
Lack of refrigerant	Normal operation except too frequent stopping and starting on low pressure control switch. Bubbles in sight glass.	Repair refrigerant leak and recharge.
Restricted liquid line drier.	Suction pressure too low and frosting at drier.	Replace drier core.
Faulty motor	Motor starts and stops rapidly.	Replace faulty motor.
Inoperative compressor Unloading system	Compressor will not load or unload.	Repair or replace faulty control.

COMPRESSOR IS NOISY

POSSIBLE CAUSE	SYMPTOMS	RECOMMENDED ACTION
Lack of oil	Compressor cuts out on oil failure control	Add oil. Check crankcase heater
Internal parts of compressor	Compressor knocks	Replace compressor
Liquid “flood back”.	Abnormally cold suction line	Check and adjust superheat, Verify correct bulb mounting.
Expansion valve stuck in open position.	Abnormally cold suction line. Compressor knocks	Repair or replace

COMPRESSOR LOSES OIL

POSSIBLE CAUSE	SYMPTOMS	RECOMMENDED ACTION
Clogged drier	Oil level gradually drops	Replace drier core.
Liquid flooding back to compressor	Excessively cold suction. Noisy compressor operation	Readjust superheat setting and verify correct bulb mounting
Short cycling	Too frequent starting and Stopping of compressor	See “Compressor short cycles”.

COMPRESSOR RUNS CONTINUOUSLY

POSSIBLE CAUSE	SYMPTOMS	RECOMMENDED ACTION
Excessive load	High leaving chilled water temperature	Check for excessive water flow.
Temperature controller set at too low a temperature	Low temperature in conditioned area	Reset or repair
“welded” contacts on electrical Control in motor starter circuit	Low temperature in conditioned space	Repair or replace contacts
Leaky valves in compressor	Compressor noisy or operating at Abnormally low discharge pressure or abnormally high suction pressure	Replace compressor
Solenoid liquid valve stuck open	Leaving air too cold	Repair valve or replace

SYSTEM SHORT OF CAPACITY

POSSIBLE CAUSE	SYMPTOMS	RECOMMENDED ACTION
Low refrigerant charge	Expansion valve hisses. Flash gas in liquid line.	Add refrigerant.
Clogged drier or restriction in Solenoid valve	Temperature change in refrigerant line through drier or solenoid valve.	Replace.
Expansion valve stuck or obstructed	Short cycling.	Replace expansion valve.
Excessive pressure drop in evaporator	Superheat too high.	Check superheat and reset Thermal expansion valve
Improper superheat adjustment.	Leaving chilled water temperature too high or too low and oil foaming	Adjust expansion valve. Check superheat.
Hot bypass solenoid or bypass Valve defective	Leaving air temperature too high	Replace
Obstructed chilled water lines.	Reduced water flow	Remove obstruction

SUCTION PRESSURE TOO LOW

POSSIBLE CAUSE	SYMPTOMS	RECOMMENDED ACTION
Lack of refrigerant.	Bubbles in sight glass.	Repair leak and charge.
Light load on chiller.	Compressor short cycles.	See “Compressor short cycles”.
Clogged liquid line drier.	Temperature change in refrigerant line through drier or solenoid valve.	Replace drier core.
Expansion valve power Assembly has lost charge.	No flow of refrigerant through valve.	Replace expansion valve assembly.
Obstructed expansion valve.	Loss of capacity.	Clean valve or replace if necessary.
Low water flow.	Low evaporator water pressure drop.	Check water flow. Check for clogged strainers, And obstruction in chilled water lines.

SUCTION PRESSURE TOO HIGH

POSSIBLE CAUSE	SYMPTOMS	RECOMMENDED ACTION
Excessive load on chiller.	Compressor runs continuously.	See “Compressor runs continuously”.
Overfeeding of expansion valve.	Abnormally cold suction line. Liquid flooding back to compressor.	Regulate superheat setting of expansion Valve and check to see that remote bulb Is properly installed.
Expansion valve stuck in Open position.	Abnormally cold suction line. Liquid flooding back to compressor.	Replace valve.
Broken suction valves in compressor.	Noisy compressor.	Replace compressor

DISCHARGE PRESSURE TOO HIGH

POSSIBLE CAUSE	SYMPTOMS	RECOMMENDED ACTION
High-pressure too high.	Excessively warm air leaving condenser cuts out on high-pressure control.	Clean condenser fouling.
Air or non-condensable gas in system.	Exceptionally hot condenser and Excessive discharge pressure.	Remove air or non-condensable.
Overcharge or refrigerant.	High leaving chilled water temperature.	Remove excess refrigerant gradually. Normal sub-cooling is 12 degrees.
Excessive system load.	Excessive discharge pressure.	Reduce load. Reduce water flow to evaporator if excessive.
Faulty hot gas solenoid valve	Excessive discharge temperature	Replace valve

DISCHARGE PRESSURE TOO LOW

POSSIBLE CAUSE	SYMPTOMS	RECOMMENDED ACTION
Lack of refrigerant.	Bubbles in sight glass.	Repair leaky and charge.
Broken or leaky compressor Discharge valves.	Suction and discharge pressures Equalize rapidly after pump down.	Replace compressor.

PLC NOT FUNCTIONING (OPTIONAL)

POSSIBLE CAUSE	SYMPTOMS	RECOMMENDED ACTION
Blown PLC fuse	No power supply at PLC	Check for short to ground and replace fuse
Program problem	LED error on or improper program	Contact Freeze Systems Limited

TOUCH SCREEN (OPTIONAL)

POSSIBLE CAUSE	SYMPTOMS	RECOMMENDED ACTION
Power failure	No DC power supply at screen	Check 24V DC power supply
No Communication	Display Frozen	Check communication cable connection
Communication settings	Display does not react	Contact FREEZE CO. SYSTEMS LTD.

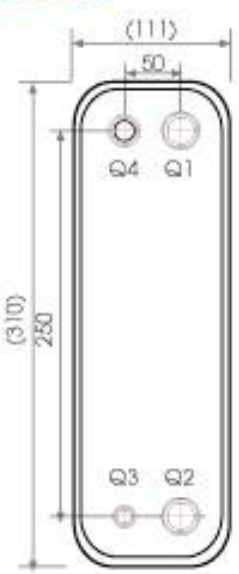
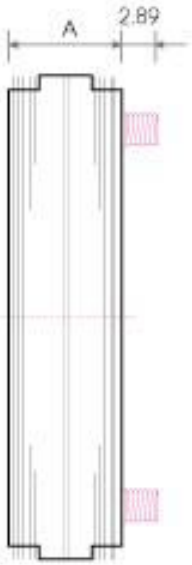
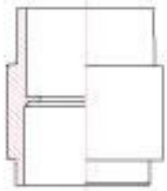
Brazed Plate Heat Exchangers

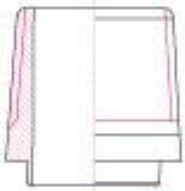
Model B3-027/BL26







Conexión soldable
El diámetro máximo de la conexión soldable es 1" 3/8



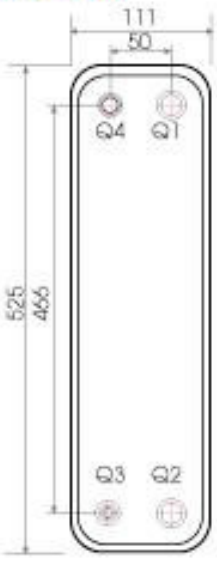
Conexión roscada
El diámetro máximo de la conexión roscada es 1" 1/4

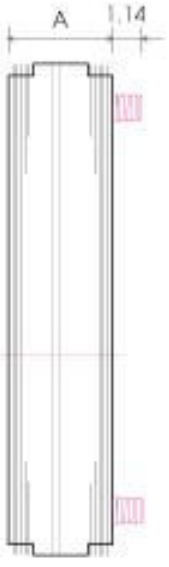
This unit can be manufactured with copper or nickel brazing, plate material available is SS304, SS316L or SM0254.

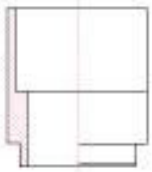
Quantity of plates	A (in)	Weight (lb)	Side volume (USGal)Q1Q2/Q3Q4	Heat exchanger area(ft²)
n	0.35+0.095n	2.6+0.28n	0.0132(1/2)n/0.0132(1/2)(n-2)	(n-2)0.28

Parameters	
Design pressure	435psi (A)
Design pressure	580psi (B)
Testing pressure	652psi (A)
Testing pressure	870psi (B)
Design Temperature	-319 to 392F
Available plate flow pattern	H,L,M
Heat load (KBtu/h)	~13.65-85.30
Quantity of max plates	150

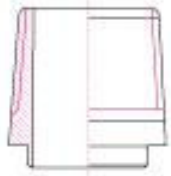
Model B3-052/BL50







Conexión soldable
El diámetro máximo de la conexión soldable es 1" 5/8



Conexión roscada
El diámetro máximo de la conexión roscada es 1" 1/4

Esta unidad puede ser fabricada con termosoldadura de cobre o de níquel, el material de las placas esta disponible en SS316L y SMO254

Cantidad de Placas	A (mm)	Peso (kg)	Q1Q2 / Q3Q4 Volumen por lado (L)	Area de Transferencia (m²)

Presión de Prueba	61.2 Kg/cm² (B)
Temperatura de Diseño	-195 to 200°C
Patrón de Flujo Disponible	H, L, M
Carga Térmica Máxima (Kcal/h)	~8,600-51,590
Cantidad Máxima de Placas	150

NOTE: ALL DIMENSIONS IN INCHES

Hex

Brazed Plate Heat Exchangers

Hex

Brazed Plate Heat Exchangers

Typical Uses

- General Heating and cooling duties in a wide range of industries
- Central Heating
- Heating and Cooling in HVAC installations
- Hydraulic and Lube Oil Coolers
- Tap water and radiator heating
- Hydronic Heating
- Geothermic and Solar Heating
- Evaporation and Condensation in Refrigeration Systems
- Heat recovery

Refrigeration

Our Brazed Plate Heat Exchangers are widely used in chillers, refrigerant systems, brine coolers and air dryers, due to its high resistance to elevated pressures they are an excellent choice when using high-pressure refrigerants.

Our Brazed Plate Heat Exchangers are designed to distribute the refrigerant uniformly in the port for the optimization of the heat transfer area.

Heating

Our main applications include Domestic Hot Water, Radiant Floor Systems, Boilers, Heat Pumps and Substations.

Our Brazed Plate Heat Exchangers effectiveness and efficiency is ideal for this applications, our compact heat exchangers can help reduce the overall size of any heating system.

Industrial

Our compact Brazed Plate Heat Exchangers are ideally suited for the most widely and diverse applications in the industrial environments, from Lube and Hydraulic Oil Coolers to Heat recovery and Steam Heating Systems our outstanding performance is highly recommended.

High Performance

Brazed Plate Heat Exchangers

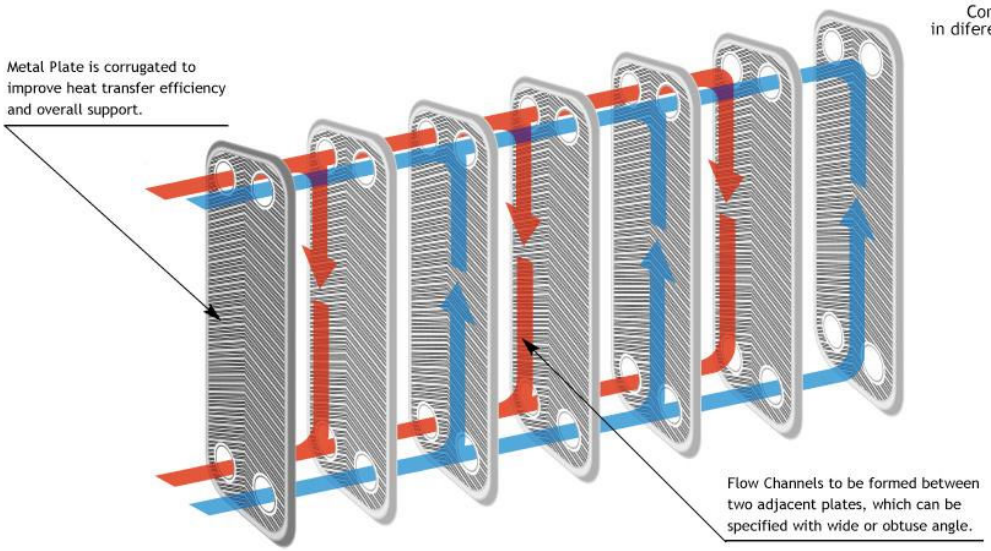
Features and Advantages

Brazed Plate Heat Exchangers are made from thin corrugated stainless steel plates, brazed with pure copper wich result in a solid and reliable device that can handle high pressures and temperatures with a outstanding thermal efficiency.

Our unique plate design enables an unlimited number of combinations in a plate package to match your specific needs of heat transfer duties.

- Stainless Steel 316L (super-low carbon stainless steel plates brazed together with 99.9% pure copper)
- Compact Durable and Cost Effective
- Outstanding Overall Heat Transfer Coeficient
- Wide Variety of Plate Sizes and Patterns
- Single & Double Distributor as well as Premixer for Refrigeration Duties
- Easy Installation & Maintenance

Stainless Steel
Connections avaliable
in diferent sizes and types



▫Compact Brazed Plate Heat Exchangers offers the same performance as large shell and tube units in a compact and reliable way.▫

Authorized Representative

Standard Shell & Tube

Basco / Whitlock Hub-Design Heat Exchanger

API Heat Transfer's extensive line of Basco/Whitlock HT, AHT, heat exchangers offers the benefits of non-ferrous construction in a highly standardized design for maximum flexibility at minimum cost. Hub design advantages include increased corrosion resistance, maximum obtainment of tube quantity in a given diameter for better efficiency, and lower entrance velocity and pressure drop as a result of the dome shell nozzle.

Sizes: 2" to 8" diameter; 8" to 96" length

Shells: Brass or 316 Stainless Steel

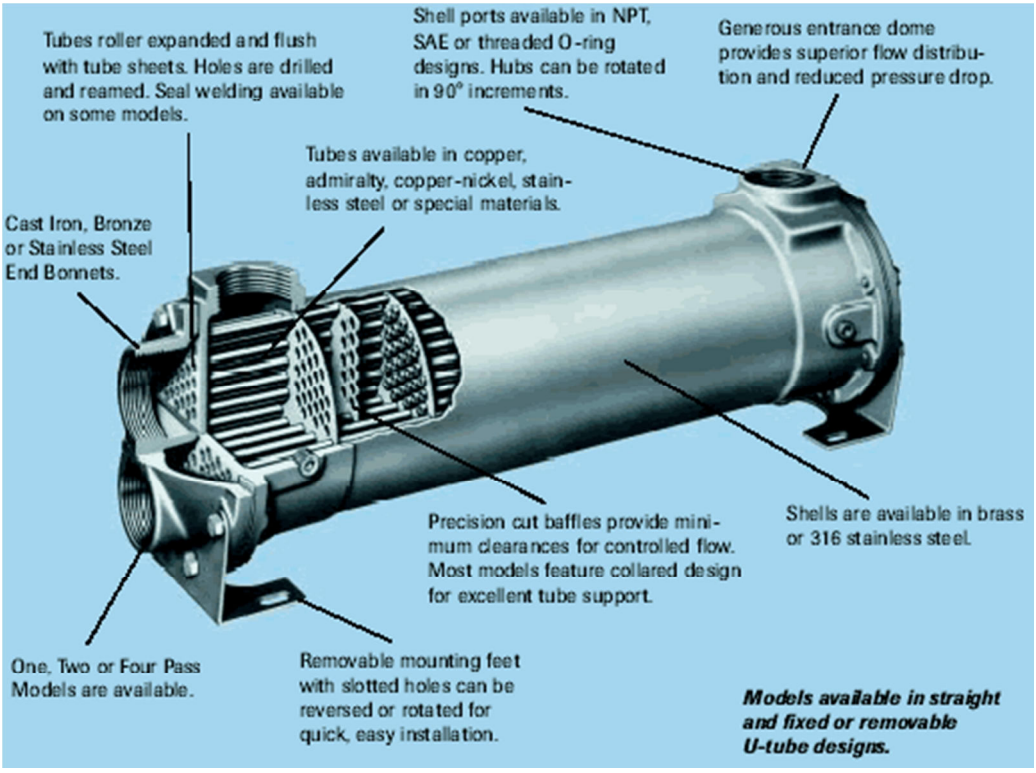
Tubes: 1/4", 3/8" or 5/8" diameter tubes available Copper, Admiralty, or 316 S/S Straight tube or U-Tube configurations

Baffles: Precision punched Brass or 316 S/S

Heads: Cast iron, Bronze, 316 S/S; Fabricated heads available in Steel, 304 S/S, or 90/10 CuNi.

Flow: Available in 1-pass, 2-pass, and 4-pass designs

Codes: Commercial Standard (non-code)
ASME (available above 4" diameter)



Type HT heat exchangers have been in production since 1965. Standard HT models feature low-cost, non-ferrous construction with brass shell, brass tubesheet and straight copper tubes. End bonnets are cast iron. Numerous

options including special materials and nozzle orientation are available.

Type AHT heat exchangers feature all 316 Stainless Steel construction in a wide variety of configurations. Modified units are suitable for critical service where ultra-clean conditions are paramount. Options include seal welding of tube to tube sheet joints and polished surfaces for pharmaceutical and food processing applications.

Type HTR and **AHTR** feature a removable tube bundle design allowing shellside cleaning and bundle replacement, rare in a low cost small diameter design where tubesheets are typically fixed. Available in non-ferrous or stainless designs.

Typical applications for Hub-Design heat exchangers include:

- Lube Oil Cooling
- Engine Jacket Water Cooling
- Hydraulic Systems
- Molding Machines
- Vegetable Oil Cooling
- Marine Applications
- Refrigerant Evaporating
- Refrigerant Condensing
- Paints and Coatings
- Vapor Recovery Systems

For complete information on this product visit our Literature section for a free download of the Basco/Whitlock Hub-Design Heat Exchangers brochure.

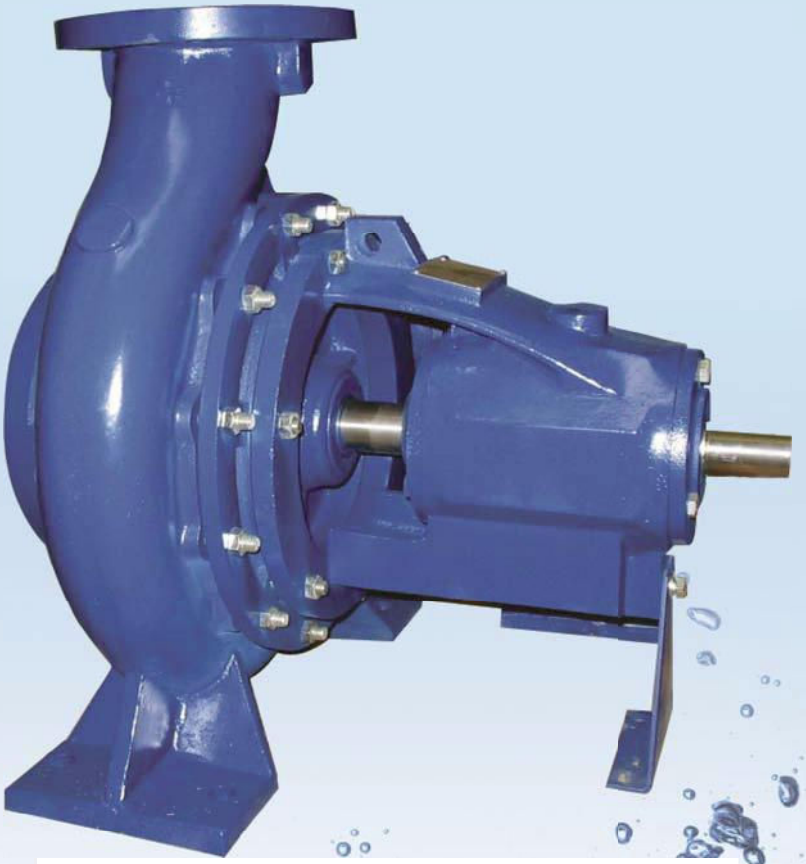
Pump

Rotech DN Series Pumps



General Purpose
End Suction Pumps

rotech
PUMPS & SYSTEMS INC.

Rotech DN Series Pumps

are general purpose, frame mounted end suction pumps flexibly Coupled to drivers. Each entire unit can be mounted on a common base plate.

Applications

DN Series pumps are designed for applications in medium duty service, providing maximum pump value in heating and air conditioning, booster and general circulating services.

Specifications

Capacities	: Up to 3000 GPM
Head	: Up to 400 feet
Pressure	: Up to 175 psi
Horsepower	: Up to 200 hp
Temperature	: From 32 F to 200 F
Drives	: Electric Motors
Liquids	: Water and Light Hydrocarbons
Materials	: Cast Iron, Bronze, Stainless Steel

Features

DN Series Pumps are available in cast iron bronze fitted and all iron Materials of Construction with type 21 mechanical seals. All stainless steel MOC can be supplied upon request.

Pump casing is fitted with a bronze/Cast Iron replaceable wear ring . Suction and Discharge connection flanges are ANSI rated 150# maximum working pressure. Rotech can supply 200# or higher rated ANSI flanges connections if required.

Motor bearings are grease lubricated and are sized for a minimum of 20,000 hours L10 basic rating life or 100,000 hours median bearing life. Shaft is designed to limit the shaft deflection to no more than .022" at the seal faces.

The motor/impeller shaft is protected with a replaceable (bronze/stainless steel) sleeve installed between the shaft and mechanical seal.

Mechanical seals are designed for water service and light hydrocarbons up to 200F. Seals are face type with Ceramic seat, carbon washer, stainless steel metal parts and Buna elastomers. MOC for mating faces and elastomers can be supplied based on application and customers requirements.

Rotech DN Series Pumps are supplied with enclosed dynamically balanced impellers for smooth, low vibration operation. The impeller is keyed to the shaft for positive driving and is secured in place with a stainless steel washer and self locking cap screw.

1. GENERAL WARNING

1.1 PLEASE READ BEFORE USING THIS MANUAL

- This manual is part of the product and should be kept near the instrument for easy and quick reference.
- The instrument shall not be used for purposes different from those described hereunder. It cannot be used as a safety device.
- Check the application limits before proceeding.

1.2 SAFETY PRECAUTIONS

- Check the supply voltage is correct before connecting the instrument.
- Do not expose to water or moisture: use the controller only within the operating limits avoiding sudden temperature changes with high atmospheric humidity to prevent formation of condensation
- Warning: disconnect all electrical connections before any kind of maintenance.
- Fit the probe where it is not accessible by the End User. The instrument must not be opened.
- In case of failure or faulty operation send the instrument back to the distributor or to Dixell S.p.A. (see address) with a detailed description of the fault.
- Consider the maximum current which can be applied to each relay (see Technical Data).
- Ensure that the wires for probes, loads and the power supply are separated and far enough from each other, without crossing or intertwining.
- In case of applications in industrial environments, the use of mains filters (our mod. FT1) in parallel with inductive loads could be useful.

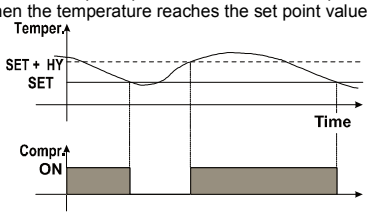
2. GENERAL DESCRIPTION

Model **XR30C**, format 32 x 74 mm, and **XR30D**, DIN rail format, are digital thermostats with off cycle defrost designed for refrigeration applications at normal temperature. They provide two relay outputs, one for the compressor, the other one can be used for alarm signalling or as auxiliary output. The probe input can be selected between PTC or NTC. The instrument has a digital input, for alarm signalling, for switching the auxiliary output or for start a defrost cycle.

3. CONTROLLING LOADS

3.1 COMPRESSOR

The regulation is performed according to the temperature measured by the thermostat probe with a positive differential from the set point: if the temperature increases and reaches set point plus differential the compressor is started and then turned off when the temperature reaches the set point value again.



In case of fault in the thermostat probe the start and stop of the compressor are timed through parameters **COn** and **COF** .

3.2 DEFROST

Defrost is performed through a simple stop of the compressor. Parameter **IdF** controls the interval between defrost cycles, while its length is controlled by parameter **MdF** .

4. FRONT PANEL COMMANDS

XR30C

XR30D

SET: To display target set point; in programming mode it selects a parameter or confirm an operation.

❄ **(DEF)** To start a manual defrost

▲ (**UP**): To see the last temperature alarm happened; in programming mode it browses the parameter codes or increases the displayed value.

▼ (**DOWN**) To see the last temperature alarm happened; hold pressed it switches the auxiliary output; in programming mode it browses the parameter codes or decreases the displayed value.

KEY COMBINATIONS:

▲ + ▼ To lock & unlock the keyboard.

SET + ▼ To enter in programming mode.

SET + ▲ To return to the room temperature display.

4.1 USE OF LEDS

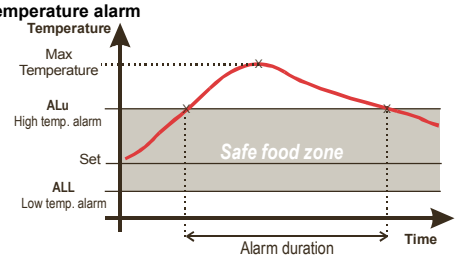
Each LED function is described in the following table.

LED	MODE	FUNCTION
❄	ON	Compressor enabled
❄	Flashing	-Programming Phase (flashing with ❄) - Anti-short cycle delay enabled
❄	ON	Defrost enabled
❄	Flashing	- Programming Phase (flashing with ❄)
AUX	ON	Second relay ON
🔔	ON	An temperature alarm happened

5. TEMPERATURE ALARM AND ITS DURATION RECORDING (HACCP)

XR30C signals and records temperature alarms, together with their duration and max value reached. See drawing:

Ex. High temperature alarm



5.1 HOW TO SEE THE ALARM DURATION AND MAX (MIN) TEMPERATURE

If the alarm LED is on, an alarm has taken place.
To see the kind of alarm, the max (min) reached temperature and alarm duration do as follows:

1. Push the Up or Down key.
2. On the display the following message is shown:: **HAL** for high temperature alarm (**LAL** fot the minimum allarm), followed by the **Maximum (minimum) temperature.** Then the **tiM** (**tiM**e) message is displayed, followed by the **Duration** in h.mm.
3. Then the instrument displays the temperature once again.

NOTE1: if an alarm is still occurring the **tim** shows the partial duration.
NOTE2: the alarm is recorded when the temperature come back to normal values

5.2 HOW TO RESET A RECORDED ALARM OR ONE THAT IS STILL OCCURRING

1. Hold the SET key pressed for more than 3s, while the recorded alarm is displayed. (the rSt message will be displayed)
2. To confirm the operation, the rSt message starts blinking and the normal temperature will be displayed.

6. MAIN FUNCTIONS

6.1 HOW TO SEE THE SETPOINT

1. Push and immediately release the **SET** key: the display will show the Set point value;
2. Push and immediately release the **SET** key or wait for 5 seconds to display the probe value again.

6.2 HOW TO CHANGE THE SETPOINT

1. Push the **SET** key for more than 2 seconds to change the Set point value;
2. The value of the set point will be displayed and the ❄ LED starts blinking;
3. To change the Set value push the ▲ or ▼ arrows within 10s.
4. To memorise the new set point value push the **SET** key again or wait 10s.

6.3 HOW TO START A MANUAL DEFROST

Push the **DEF** key for more than 2 seconds and a manual defrost will start.

6.4 HOW TO SWITCH ON OR OFF THE SECOND RELAY (OAC= LHt)

Hold pressed the ▼ key for some seconds, till the **AUX** LED is turned ON or OFF

6.5 HOW TO CHANGE A PARAMETER VALUE

To change the parameter s value operate as follows:

1. Enter the Programming mode by pressing the Set and DOWN key for 3s (❄ and ❄ start blinking).
2. Select the required parameter.
3. Press the **SET** key to display its value (now only the ❄ LED is blinking).
4. Use **UP** or **DOWN** to change its value.

5. Press **SET** to store the new value and move to the following parameter.

To exit: Press **SET + UP** or wait 15s without pressing a key.
NOTE: the set value is stored even when the procedure is exited by waiting the time-out to expire.

6.6 THE HIDDEN MENU

The hidden menu Includes all the parameters of the instrument.

6.6.1 HOW TO ENTER THE HIDDEN MENU

1. Enter the Programming mode by pressing the Set + ▼ key for 3s (LED 1 and ❄ start blinking).
2. When a parameter is displayed keep pressed the Set+▼ for more than 7s. The Pr2 label will be displayed immediately followed from the HY parameter. **NOW YOU ARE IN THE HIDDEN MENU.**
3. Select the required parameter.
4. Press the **SET** key to display its value (Now only the ❄ LED is blinking).
5. Use ▲ or ▼ to change its value.
6. Press **SET** to store the new value and move to the following parameter.

To exit: Press **SET +** ▲ or wait 15s without pressing a key.
NOTE: the set value is stored even when the procedure is exited by waiting the time-out to expire.

6.6.2 HOW TO MOVE A PARAMETER FROM THE HIDDEN MENU TO THE FIRST LEVEL AND VICEVERSA.

Each parameter present in the HIDDEN MENU can be removed or put into THE FIRST LEVEL (user level) by pressing **SET +** ▼ .
In HIDDEN MENU when a parameter is present in First Level the decimal point is on.

6.7 HOW TO LOCK THE KEYBOARD

1. Keep pressed for more than 3 s the ▲ and ▼ keys.
2. The **POF** message will be displayed and the keyboard will be locked. At this point it will be possible only to see the set point or the MAX o Min temperature stored
3. If a key is pressed more than 3s the POF message will be displayed.

6.8 TO UNLOCK THE KEYBOARD

Keep pressed together for more than 3s the ▲ and ▼ keys, till the **Pon** message will be displayed.

6.9 THE CONTINUOUS CYCLE

When defrost is not in progress, it can be activated by holding the ▲ key pressed for about 3 seconds.

The compressor operates in continuous mode for the time set through the **CCt** parameter. The cycle can be terminated before the end of the set time using the same activation key ▲ for 3 seconds.

7. PARAMETERS

NOTE: the parameters preceded by dots are in the Hidden Menu.

REGULATION

Hy Differential: (0,1 ÷ 25,5°C / 1÷255 °F) Intervention differential for set point. Compressor Cut IN is Set Point Plus Differential (Hy). Compressor Cut OUT is when the temperature reaches the set point.

- ***LS Minimum set point**: (- 50°C÷SET/-58°F÷SET): Sets the minimum acceptable value for the set point.*
- ***US Maximum set point**: (SET÷110°C/ SET÷230°F). Set the maximum acceptable value for set point.*

Ot Thermostat probe calibration: (-12.0÷12.0°C; -120÷120°F) allows to adjust possible offset of the thermostat probe.

- ***OdS Outputs activation delay at start up:** (0÷255min) This function is enabled at the initial start up of the instrument and inhibits any output activation for the period of time set in the parameter.*

AC Anti-short cycle delay: (0÷50 min) minimum interval between the compressor stop and the following restart.

- ***CCt Compressor ON time during continuous cycle**: (0.0÷24.0h; res. 10min) Allows to set the length of the continuous cycle: compressor stays on without interruption for the CCt time. Can be used, for instance, when the room is filled with new products.*
- ***COn Compressor ON time with faulty probe**: (0÷255 min) time during which the compressor is active in case of faulty thermostat probe. With COn=0 compressor is always OFF.*
- ***COF Compressor OFF time with faulty probe**: (0÷255 min) time during which the compressor is OFF in case of faulty thermostat probe. With COF=0* compressor is always active.

CH Type of action: CL = cooling; Ht = heating.

DISPLAY

- ***CF Temperature measurement unit**: **°C**=Celsius; **°F**=Fahrenheit. **WARNING**: When the measurement unit is changed the SET point and the values of the parameters Hy, LS, US, Ot, ALU and ALL have to be checked and modified if necessary).*

rES Resolution (for °C): (in = 1°C; dE = 0.1 °C) allows decimal point display.

DEFROST

IdF Interval between defrost cycles: (0÷120h) Determines the time interval between the beginning of two defrost cycles.

MdF (Maximum) length for defrost: (0÷255min) When **P2P = n**, (not evaporator probe: timed defrost) it sets the defrost duration, when **P2P = y** (defrost end based on temperature) it sets the maximum length for defrost.

- ***dFd Temperature displayed during defrost**: (**rt** = real temperature; **it** = temperature at defrost start; **SEt** = set point; **dEF** = dEF label)*
- ***dAd MAX display delay after defrost**: (0÷255min). Sets the maximum time between the end of defrost and the restarting of the real room temperature display.*

ALARMS

- ***ALC Temperature alarms configuration**: (Ab; rE)*
  ***Ab**= absolute temperature: alarm temperature is given by the ALL or ALU values. **rE** = temperature alarms are referred to the set point. Temperature alarm is enabled when the temperature exceeds the SET+ALU or SET-ALL values.*

ALU MAXIMUM temperature alarm: (SET÷110°C; SET÷230°F) when this temperature is reached the alarm is enabled, after the ALd delay time.

ALL Minimum temperature alarm: (-50.0 ÷ SET°C; -58÷230°F when this temperature is reached the alarm is enabled, after the ALd delay time.

- ***ALd Temperature alarm delay**: (0÷255 min) time interval between the detection of an alarm condition and alarm signalling.*
- ***dAO Exclusion of temperature alarm at startup**: (from 0.0 min to 23.5h) time interval between the detection of the temperature alarm condition after instrument power on and alarm signalling.*

SECOND RELAY AND DIGITAL INPUT (IF AVAILABLE)

- ***tbA Alarm relay silencing (with oAC=ALr)**:*
  *(**n**= silencing disabled: alarm relay stays on till alarm condition lasts, **y** =silencing enabled: alarm relay is switched OFF by pressing a key during an alarm).*

OA1 Second relay configuration: ALr: alarm; **LHt**: auxiliary; **onF**: always on; **dEF:** do not select it!.; **FAn:** do not select it!.;

AoP Alarm relay polarity: it set if the alarm relay is open or closed when an alarm happens. **CL**= the relay is closed; **oP** = the relay is open

i1P Digital input polarity: oP: the digital input is activated by opening the contact; **CL:** the digital input is activated by closing the contact.

i1F Digital input configuration: EAL = external alarm: EA message is displayed; **bAL** = serious alarm CA message is displayed. **PAL** = pressure switch alarm, CA message is displayed; **dor** = door switch function; **dEF** = activation of a defrost cycle; **LHt** =switch on the second relay if oA1=LHt; **Htr** = kind of action inversion (cooling heating).

did: (0÷255 min)
with i1F= EAL or i1F = bAL digital input alarm delay: delay between the detection of the external alarm condition and its signalling.
with i1F= dor: door open signalling delay

with i1F = PAL: time for pressure switch function: time interval to calculate the number of the pressure switch activation.

nPS Pressure switch number: (0 ÷15) Number of activation of the pressure switch, during the **did** interval, before signalling the alarm event (I2F= PAL). **If the nPS activation in the did time is reached, switch off and on the instrument to restart normal regulation.**

- ***odc*** ***Compressor status when open door: no, Fan*** *= normal;* ***CPr, F_C*** *= Compressor OFF*

OTHER

PbC Type of probe: it allows to set the kind of probe used by the instrument: **PbC** = PBC probe, **ntC =** NTC probe.

- ***rEL*** ***Software release*** *for internal use.*
- ***Ptb*** ***Parameter table code:*** *readable only.*

8. DIGITAL INPUT (IF AVAILABLE)

The free contact digital input is programmable in five different configurations by the **i1F** parameter.

8.1 DOOR SWITCH INPUT (i1F = dor)

It signals the door status and the corresponding relay output status through the **odc** parameter: **no, Fan** = normal (any change);
CPr, F_C = Compressor OFF;
Since the door is opened, after the delay time set through parameter **did** , the door alarm is enabled, the display shows the message **dA** and **the regulation restarts**. The alarm stops as soon as the external digital input is disabled again. With the door open, the high and low temperature alarms are disabled.

8.2 GENERIC ALARM (i1F = EAL)

As soon as the digital input is activated the unit will wait for **did** time delay before signalling the **EAL** alarm message. The outputs status don t change. The alarm stops just after the digital input is de-activated.

8.3 SERIOUS ALARM MODE (i1F = bAL)

When the digital input is activated, the unit will wait for **did** delay before signalling the **CA** alarm message. The relay outputs are switched OFF. The alarm will stop as soon as the digital input is de-activated.

8.4 PRESSURE SWITCH (i1F = PAL)

If during the interval time set by **did** parameter, the pressure switch has reached the number of activation of the **nPS** parameter, the **CA** pressure alarm message will be displayed. The compressor and the regulation are stopped. When the digital input is ON the compressor is always OFF.
If the nPS activation in the did time is reached, switch off and on the instrument to restart normal regulation.

8.5 SWITCHING SECOND RELAY ON (i1F = LHt)

With **oA1= LHt** it switches on and off the second relay.

8.6 START DEFROST (i1F = dFr)

It starts a defrost if there are the right conditions. After the defrost is finished, the normal regulation will restart only if the digital input is disabled otherwise the instrument will wait until the MdF safety time is expired.

8.7 INVERSION OF THE KIND OF ACTION: HEATING-COOLING (i1F = Htr)

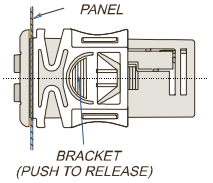
This function allows to invert the regulation of the controller: from cooling to heating and viceversa.

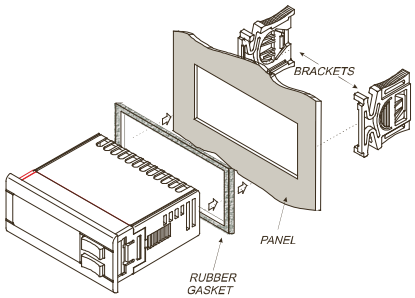
8.8 DIGITAL INPUTS POLARITY

The digital input polarity depends on the **i1P** parameter.
i1P=CL: the input is activated by closing the contact.
i1P=OP: the input is activated by opening the contact

9. INSTALLATION AND MOUNTING

Instrument **XR30C** shall be mounted on vertical panel, in a 29x71 mm hole, and fixed using the special bracket supplied.
To obtain an IP65 protection grade use the front panel rubber gasket (mod. RG-C) as shown in figure.
Instrument **XR30D** shall be mounted on an omega DIN rail





The temperature range allowed for correct operation is 0÷60 °C. Avoid places subject to strong vibrations, corrosive gases, excessive dirt or humidity. The same recommendations apply to probes. Let air circulate by the cooling holes.

10. ELECTRICAL CONNECTIONS

The instrument is provided with screw terminal block to connect cables with a cross section up to 2,5 mm^2. Before connecting cables make sure the power supply complies with the instrument s requirements. Separate the probe cables from the power supply cables, from the outputs and the power connections. Do not exceed the maximum current allowed on each relay, in case of heavier loads use a suitable external relay.

10.1 PROBE CONNECTION

The probes shall be mounted with the bulb upwards to prevent damages due to casual liquid infiltration. It is recommended to place the thermostat probe away from air streams to correctly measure the average room temperature. Place the defrost termination probe among the evaporator fins in the coldest place, where most ice is formed, far from heaters or from the warmest place during defrost, to prevent premature defrost termination.

11. HOW TO USE THE HOT KEY

11.1 HOW TO PROGRAM A HOT KEY FROM THE INSTRUMENT (UPLOAD)

1. Program one controller with the front keypad.
2. When the controller is ON, insert the **Hot key** and push ▲ key; the **"uPL"** message appears followed a by flashing **End**
3. Push **SET** key and the **End** will stop flashing.
4. Turn OFF the instrument remove the **Hot Key ,** then turn it ON again.

NOTE: the **Err** message is displayed for failed programming. In this case push again ▲ key if you want to restart the upload again or remove the **Hot key** to abort the operation.

11.2 HOW TO PROGRAM AN INSTRUMENT USING A HOT KEY (DOWNLOAD)

1. Turn OFF the instrument.
2. Insert a **programmed Hot Key into the 5 PIN receptacle** and then turn the Controller ON.
3. Automatically the parameter list of the **Hot Key** is downloaded into the Controller memory, the **doL** message is blinking followed a by flashing **End .**
4. After 10 seconds the instrument will restart working with the new parameters.
5. Remove the **Hot Key ..**

NOTE the message **Err** is displayed for failed programming. In this case turn the unit off and then on if you want to restart the download again or remove the **Hot key** to abort the operation.

12. ALARM SIGNALS

Message	Cause	Outputs
P1	Room probe failure	Compressor output according to par. Con and COF
HA	Maximum temperature alarm	Outputs unchanged.
LA	Minimum temperature alarm	Outputs unchanged.
dA	Door open	Regulation restarts
EA	External alarm	Output unchanged.
CA	Serious external alarm (i1F=bAL)	All outputs OFF.
CA	Pressure switch alarm (i1F=PAL)	All outputs OFF

12.1 ALARM RECOVERY

Probe alarm **P1** starts some seconds after the fault in the related probe; it automatically stops some seconds after the probe restarts normal operation. Check connections before replacing the probe.
Temperature alarms **HA** and **LA** automatically stop as soon as the thermostat temperature returns to normal values and when defrost starts.
Alarms **EA** and **CA** (with i1F=bAL) recover as soon as the digital input is disabled.
Alarm **CA** (with i1F=PAL) recovers only by **switching off and on** the instrument.

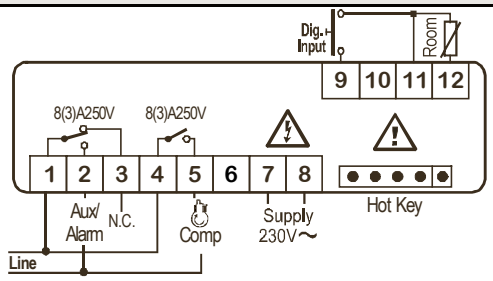
13. TECHNICAL DATA

Housing: self extinguishing ABS.
Case: XR30C frontal 32x74 mm; depth 60mm;
XR30D 4 DIN modules 70x85 mm; depth 61mm
Mounting: XR30C panel mounting in a 71x29mm panel cut-out
XR30D DIN RAIL mounted in a omega (3) din rail
Protection: IP20.
Frontal protection: XR30C IP65 with frontal gasket RG-C (optional).
Connections: Screw terminal block ≤ 2,5 mm^2 wiring.
Power supply: according to the model: 12Vac/dc, ±10%; 24Vac/dc, ±10%; 230Vac ±10%, 50/60Hz, 110Vac ±10%, 50/60Hz
Power absorption: 3VA max
Display: 3 digits, red LED, 14,2 mm high.
Inputs: 1 NTC or PTC probe.
Digital input: free contact
Relay outputs
compressor: SPST relay 8(3) A, 250Vac or

SPST relay 20(8)A; 250Vac
second relay: SPDT relay 8(3) A, 250Vac or
Data storing: on the non-volatile memory (EEPROM).
Kind of action: 1B; **Pollution grade:** normal; **Software class:** A.
Operating temperature: 0÷60 °C.
Storage temperature: -30÷85 °C.
Relative humidity: 20÷85% (no condensing)
Measuring and regulation range:
NTC probe: -40÷110°C (-40÷230°F)
PTC probe: -50÷150°C (-58÷302°F)
Resolution: 0,1 °C or 1°C or 1 °F (selectable).
Accuracy (ambient temp. 25°C): ±0,7 °C ±1 digit

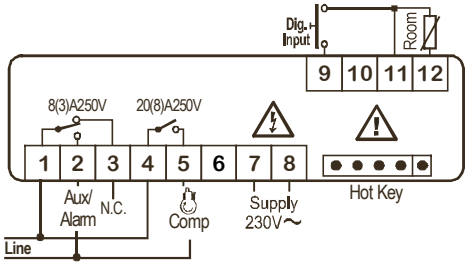
14. CONNECTIONS

14.1 XR30C: 8A COMPRESSOR



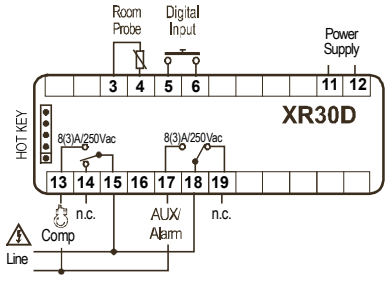
12Vac/dc supply: connect to the terminals 7 and 8.
24Vac/dc supply: connect to the terminals 7 and 8.
120Vac supply: connect to the terminals 7 and 8.

14.2 XR30C: 20A COMPRESSOR



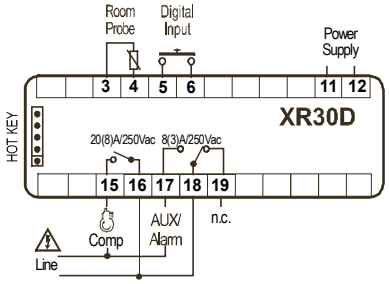
12Vac/dc supply: connect to the terminals 7 and 8.
24Vac/dc supply: connect to the terminals 7 and 8.
120Vac supply: connect to the terminals 7 and 8.

14.3 XR30D: 8A COMPRESSOR



24Vac/dc supply: connect to the terminals 11 and 12.
120Vac supply: connect to the terminals 11 and 12.
230Vac supply: connect to the terminals 11 and 12.

14.4 XR30D: 20A COMPRESSOR



24Vac/dc supply: connect to the terminals 11 and 12.
120Vac supply: connect to the terminals 11 and 12.
230Vac supply: connect to the terminals 11 and 12.

15. DEFAULT SETTING VALUES

Label	Name	Range	°C/°F
Set	Set point	LS÷US	3.0/37
Hy	Differential	0,1÷25.5°C/ 1÷ 255°F	2.0/4
LS	Minimum set point	-50°C÷SET/-58°F÷SET	-50,0/-58
US	Maximum set point	SET÷110°C/ SET ÷ 230°F	110/230
Ot	Thermostat probe calibration	-12÷12°C /-120÷120°F	0.0
OdS	Outputs delay at start up	0÷255 min	0
AC	Anti-short cycle delay	0 ÷ 50 min	1
CCt	Continuos cycle duration	0.0÷24.0h	0.0
COn	Compressor ON time with faulty probe	0 ÷ 255 min	15
COF	Compressor OFF time with faulty probe	0 ÷ 255 min	30
CH	Kind of action	CL=cooling; Ht= heating	CL
CF	Temperature measurement unit	°C ÷ °F	°C/°F
rES	Resolution	in=integer; dE= dec.point	dE/-
IdF	Interval between defrost cycles	1 ÷ 120 ore	8
MdF	(Maximum) length for defrost	0 ÷ 255 min	20
dFd	Displaying during defrost	rt, it, SEt, DEF	it
dAd	MAX display delay after defrost	0 ÷ 255 min	30
ALc	Temperat. alarms configuration	rE= related to set; Ab = absolute	Ab
ALU	MAXIMUM temperature alarm	Set÷110.0°C; Set÷230°F	110/230
ALL	Minimum temperature alarm	-50.0°C÷Set/ -58°F÷Set	-50/-58
ALd	Temperature alarm delay	0 ÷ 255 min	15
dAO	Delay of temperature alarm at start up	0 ÷ 23h e 50	1.3
tbA	Alarm relay silencing	n=no; y=yes	Y
oA1	2nd relay configuration	ALr= alarm; dEF=no select it; LHt=auxiliary; onF=always on; Fan= no select it	LHt
AoP	Second relay polarity (oA1=ALr)	oP; cL	cL
i1P	Digital input polarity	oP=opening;CL=closing	cL
i1F	Digital input configuration	EAL=extern. alarm; bAL=lock regulation; PAL=press. switch; dor=door switch; dEF=defrost; LHt=switch on 2nd relay; Htr= cooling - heating	LHt
did	Digital input alarm delay	0÷255min	5
Nps	Number of activation of pressure switch	0 ÷15	15
odc	Compressor status with open door:	no, Fan = normal; CPr; F_C = Compr. OFF;	no
PbC	Kind of probe	Ptc; ntc	ntc/Ptc
rEL	Software release	--	4.0
Ptb	Map code	--	-

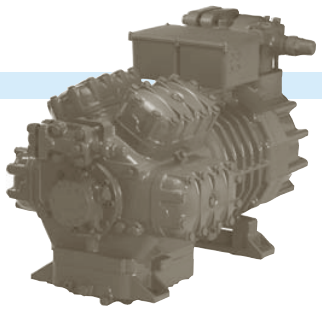
Compresseurs semi-hermétiques
Semi-hermetic compressors
Compresores semihermeticos
Compressores semi-herméticos



Dotation standard
Les compresseurs sont entièrement équipés de soupapes d'aspiration et de refoulement (raccords à souder), supports anti-vibrations en caoutchouc, remplis d'huile lubrifiante, charge d'azote (1 bar) pour les préserver de l'humidité, indicateur de niveau d'huile, dispositives de protection.
Les compresseurs série V, Z et W sont équipés de pompe de lubrification et bride universelle pour monter le pressostat d'huile.
La dotation standard peut être complétépar une vaste gamme d'accessoires propes à garantir rendement et fiabilité à tous les conditions de fonctionnement prévues.
Tous les modéles sont vernis par une couche d'antirouille et par une couche de peinture en émail bleu.

Moteurs électriques
Toute la gamme des moteurs électriques disponibles et leurs caratteristiques électriques sont illustrés à la page 22 "Données électriques".
Tous les modéles peuvent être demander en version 50 Hz.
Pour d'autres voltages, consulter notre service technique.

Protection du compresseur
Les compresseurs avec moteur triphasé sont entièrement fournis de protection constitué d'une série de thermisteurs PTC introduits dans le stator du moteur électrique et branchés au module électronique de commande (T00ECA01 pour les compresseurs série A, B, C, D, F, Q et S; T00ECA11 pour les compresseurs série V, Z et W).
Les compresseurs série V, Z et W sont aussi équipés par une sensor à thermistor sur le refoulement, il est relié au module électronique pour la commande de la température de compression.
Pour les compresseurs série Q et S le sensor à thermisteur est fourni sur demande.

Graissage
Sur les séries A, B, C, D, F, Q et S le graissage se fait par centrifugation.
Sur les séries V, Z et W le graissage s'effectue par pompe à huile à haute pression.
Les compresseurs lubrifiés par pompe à huile sont pourvus de filtre à huile et de raccords pour le contrôle de la pression de l'huile.

Accessoires
FRASCOLD a sélectionné et mis au point, pour ses compresseurs, une série complète d'accessoires propres à garantir l'efficacité et la fiabilité à toutes les conditions d'application prevues.
Toute la gamme d'accessoires disponible est illustré à la page 35.

Standard equipment
The compressors are supplied with suction and discharge valves (sweat connections), rubber vibration absorbers, oil lubrication charge, nitrogen charge (1 bar) to protect compressor against humidity, oil sight glass and protection devices.
V, Z and W series are equipped with oil pump and universal bracket suitable for oil pressure switch mounting.
On request, compressor can be completed with a large range of optional equipments suitable for efficient and reliable functioning at every operative condition.
Compressors are coated with anti-rust protective primer and blue enamel coat.

Electric motors
Page 22 "Electric data" features the electric characteristics and performances of the whole range of available motors.
All models are also available with 50Hz electric motor.
For different voltages, please contact our Technical Department.

Protection devices
For all compressors, protection is performed by means a series of PTC thermistors placed into the stator winding of the electric motor and plugged to an electronic control module (T00ECA01 for A, B, C, D, F, Q and S compressors and model T00ECA11 for V, Z and W compressors).
V, Z and W series compressors are supplied with discharge gas high temperature protection composed of a PTC thermistor sensor plugged to the electronic control module.
PTC thermistor sensor is supplied on request for Q and S series compressors.

Lubrication
For compressors of A, B, C, D, F, Q and S series, lubrication is carried out by centrifugation with an oil thrower disc.
V, Z and W series compressors lubrication is performed by an high pressure oil pump and equipment includes oil filter and oil pressure connections.

Optional equipments
FRASCOLD has selected and developed a complete range of accessories to equipe, on request, the compressor for an efficient and reliable running at every operating condition. The whole range of available optional equipments is featured on page 35.

Equipamiento estándard
Los compresores se suministran con la válvula de aspiración y de descarga (conexiones a soldar), soportes de goma antivibración , carga de aceite lubricante, carga de nitrógeno (1 bar) para proteger el compresor contra humedad, visor de nivel de aceite y dispositivos de protección. Las series V, Z y W, incorporan bomba de aceite y soporte universal para el montaje del interruptor electronico de presión del aceite.
Bajo demanda, el compresor puede incorporar una gama completa de accesorios idóneos para garantizar la eficiencia y fiabilidad en todas las condiciones de funcionamiento previstas.
Los compresores están protegidos con pintura protectora antioxidante de color azul.

Motor eléctrico
Toda la gama de motores eléctricos disponibles y sus características eléctricas están documentadas en la página 22 "Datos eléctricos". Todos los modelos están disponibles también para una frecuencia 50 Hz. Para otras tensiones, contactar con el Departamento Técnico.

Protección del compresor
Todos los compresores disponen de un dispositivo de protección constituido por una serie de termistores PTC instalados en los bobinados del estator del motor eléctrico y unidos a un módulo de control electrónico (T00ECA01 para las series A, B, C. D, F. Q y S y , modelo T00ECA11 para los compresores de la serie V, de Z y de W).
Los compresores de la serie V, Z y W, incorporan la protección de temperatura de descarga del compresor, integrada por un termistor PTC conectado al módulo de control electrónico.
Este termistor PTC es opcional para los compresores de la serie de Q y S.

Lubricación
Para las series de compresores A, B, C, D, F, Q y S, la lubricación se realiza mediante un disco centrifugador de aceite.
Para las series V, Z y W, la lubricación se realiza mediante una bomba de alta presión de aceite y el equipo incluye un filtro de aceite y conexiónes de aceite.

Equipamiento opcional
FRASCOLD ha seleccionado y desarrollado para sus compresores una gama completa de accesorios idóneos para garantizar la eficiencia y fiabilidad en todas las condiciones de funcionamiento previstas.
La gama completa de opcionales se encuentra descrita en la página 35.

Equipamento standard
Os compressores vêm equipados com válvulas de aspiração e compressão (conexões de soldar), pés amortecedores em borracha, carga de óleo lubrificante, carga de nitrogênio a 1 bar (para proteger o compressor da umidade), visor de nível de óleo e proteção elétrica. As séries V, Z e W estão dotadas com bomba de óleo e um suporte universal para montagem do pressostato eletrônico de óleo.
A pedido, os compressores podem ser equipados com uma larga gama de acessórios opcionais concebidos para um funcionamento seguro e eficiente em todas as condições de trabalho.
Os compressores são pintados com uma proteção primária anti-ferrugem e revestidos com tinta esmalte azul.

Motores elétricos
Na página 22 estão detalhadas as características elétricas e performances da gama completa de motores elétricos disponíveis. Todos os modelos estão disponíveis com motores elétricos a 60 Hz. Para voltagens ou freqüências diferentes, contatar o Departamento Técnico.

Proteção do compressor
Todos os compressores são dotados de proteção constituída por uma série de sondas PTC inseridas no estator do motor elétrico e ligadas ao módulo eletrônico de controle (T00ECA01 para os compressores das séries A, B, C, D, F, Q e S; T00ECA11 para os compressores das séries V, Z e W).
Os compressores das séries V, Z e W estão equipados com um sensor (sonda PTC) na compressão, ligado ao módulo eletrônico, para controle da temperatura de descarga pode ser fornecido sob pedido.

Lubrificação
Para os compressores das séries A, B, C, D, F, Q e S, a lubrificação é efetuada por spray de óleo, através de um disco centrifugador de óleo.
Nos compressores das séries V, Z e W, a lubrificação realiza-se por médio de uma bomba de óleo de alta pressão e o equipamento inclui filtro de óleo, conexão para ligação do pressostato diferencial de pressão de óleo.

Acessórios opcionais
A FRASCOLD desenvolveu e selecionou uma gama completa de acessórios para equipar os compressores de modo a garantir um funcionamento seguro e eficiente em todas as condições de trabalho admitidas. Estes acessórios podem ser fornecidos sob pedido.
A gama completa de acessórios opcionais está descrita na página 35.

Puissances frigorifiques

Les puissances frigorifiques, reportées sur les tableaux de la page 6 à la page 21, ont été calculées selon les conditions suivantes:
- alimentation 60Hz
- sans sous-refroidissement du liquide
- température ambiante 32°C
- **température du gaz aspiré 20°C**

R407c - les températures d'evaporation et de condensation se réfèrent aux point de roseé, in conformité avec la norme EN12900.

Refrigerating capacity

Refrigerating capacities shown in page 6 up to page 21 are based on the following conditions:
- power supply 60Hz
- without liquid subcooling
- ambient temperature 32°C
- **suction gas temperature 20°C**

R407c - Evaporating and condensing temperatures are based on dew temperature, according to EN12900 standard.

Capacidades frigoríficas

Las capacidades frigoríficas indicadas en las tablas desde la pág.6 a la pág.21 se han calculado en las condiciones siguientes:
- alimentación 60Hz
- no subenfriamiento liquido
- temperatura ambiente 32°C
- **temperatura gas aspirado 20°C**

R407c - Evaporación y condensación se refieren a los valores de punto de rocío según EN12900

Capacidades frigorificas

As capacidades frigoríficas, transcritas nas tabelas a partir da pagina 6 ate pagina 21, foram calculadas nas seguintes condições:
- freqüência em 60Hz
- nenhum sub-resfriamento do liquido
- temperatura ambiente 32°C
- **temperatura gas aspirado 20°C**

R407c - Evaporação e condensação são baseados nos valores de ponto de orvalho conforme EN12900

Facteurs de correction / Conversion factors / Factores de conversión / Fatores de conversão

Réfrigérant / Refrigerant / Refrigerante / Refrigerante **R507**

Température de condensation / Condensing temperature / Temperatura de condensacion / Temperatura de condensação	Température d'évaporation °C / Evaporating temperature °C / Temperatura de evaporación °C / Temperatura de evaporação °C												
	12.5	7.5	5	0	-5	-10	-15	-20	-25	-30	-35	-40	-45
	Facteur de correction / Conversion factor / Factor de correción / Fator de conversão												
30°C						1.02	1.02	1.02	1.03	1.03	1.03	1.03	1.03
40°C						1.02	1.03	1.03	1.03	1.04	1.04	1.04	1.04
45°C						1.03	1.03	1.04	1.04	1.04	1.04	1.04	1.04
50°C						1.03	1.04	1.04	1.04	1.04	1.05	1.05	1.05

Les valeurs de puissance frigorifique peuvent être calculées en multipliant les données des tableaux de la page 6 à la page 9 par le facteur concernant les températures d'évaporation et de condensation considérées; par exemple:
compresseur modèle D 3 18 Y
réfrigérant R507
temp. d'évaporation -25°C
temp. de condensation 50°C
puissance frigorifique 4940 W
facteur de correction 1.04
puissance frigorifique correcte:
4940 x 1.04 = 5138 W

To calculate actual refrigerating capacity, multiply capacity table value (see page 6 up to page 9) by proper conversion factor related to considered condensing and evaporating temperatures; example:
compressor model D 3 18 Y
refrigerant R507
evaporating temperature -25°C
condensing temperature 50°C
refrigerating capacity 4940 W
conversion factor 1.04
actual refrigerating capacity:
4940 x 1.04 = 5138 W

Los valores de capacidades frigoríficas pueden calcularse miltiplicando los datos de las tablas desde la pág. 6 a la pág. 9 por el factor relativo a las temperaturas de evaporación y condensación consideradas; ejemplo:
compresor modelo D 3 18 Y
refrigerante R507
temp. de evaporación -25°C
temp. de condensación 50°C
capacidad frigorífica 4940 W
factor de correción 1.04
capacidad frigorífica correcta:
4940 x 1.04 = 5138 W

Os valores de capacidade frigorífica podem ser calculados multiplicando os dados das tabelas da página 6 ate pagina 9 por um fator relativo as temperaturas de evaporação e condensação consideradas. Exemplo:
compressor modelo D 3 18 Y
refrigerante R507
temperatura de evaporação -25°C
temperatura de condensação 50°C
capacidade frigorífica 4940 W
fator de conversão 1.04
capacidade frigorífica correta:
4940 x 1.04 = 5138 W

Réfrigérant / Refrigerant / Refrigerante / Refrigerante **R22**

Température de condensation / Condensing temperature / Temperatura de condensacion / Temperatura de condensação	Température d'évaporation °C / Evaporating temperature °C / Temperatura de evaporación °C / Temperatura de evaporação °C												
	12.5	7.5	5	0	-5	-10	-15	-20	-25	-30	-35	-40	-45
	Facteur de correction / Conversion factor / Factor de correción / Fator de conversão												
30°C												0.890	0.871
40°C										0.911	0.896	0.875	0.857
45°C									0.927	0.908	0.892	0.871	0.852
50°C								0.940	0.924	0.905	0.888	0.846	0.846

I valori di capacità frigorifera durante l'iniezione di liquido possono essere calcolati moltiplicando i dati delle tabelle da pagina15 a pagina 17 per il fattore relativo alle temperature di evaporazione e condensazione considerate; esempio:
compressore modello S 7 39 Y
refrigerante R22
temp. di evaporazione -30°C
temp. di condensazione 50°C
resa frigorifera 7240 W
fattore di correzione 0.905
resa frigorifera corretta:
7240 x 0.905 = 6552 W

To calculate actual refrigerating capacity during liquid injection, multiply capacity table value (see page 15 and page 17) by proper conversion factor related to considered condensing and evaporating temperatures.
Example:
compressor model S 7 39 Y
refrigerant R22
evaporating temperature -30°C
condensing temperature 50°C
refrigerating capacity 7240 W
conversion factor 0.905
actual refrigerating capacity:
7240 x 0.905 = 6552 W

Los valores de capacidades frigorífica durante la inyección de liquido pueden calcularse multiplicando los datos de las pág 6 y 17 por el factor relativo a las temperaturas de evaporación y condensación consideradas.
Ejemplo:
compresor modelo S 7 39 Y
refrigerante R22
temp. de evaporación -30°C
temp. di condensación 50°C
capacidad frigorífica 7240 W
factor de corrección 0.905
capacidad frigorífica correcta:
7240 x 0.905 = 6552 W

Os valores de capacidade frigorífica durante a injeção podem ser calculados multiplicando os dados das tabelas das paginas 16 e 17 por um fator relativo as temperaturas de evaporação e condensação consideradas.
Exemplo:
compressor modelo S 7 39 Y
refrigerante R22
temperatura de evaporação -30°C
temperatura de condensação 50°C
capacidade frigorífica 7240 W
fator de conversão 0.905
capacidade frigorífica correta:
7240 x 0.905 = 6552 W

Avec refroidissement de la culasse
With head cooling
Con culata enfriada
Com resfriamento do cabeçote

Refroidissement par injection de liquide et par motoventilateur sur la culasse
Cooling with liquid injection and head fan motor
Enfriamiento con inyección de liquido y culata enfriada por aire
Resfriamento com injeção de liquido e cabeçote resfriado a ar

FCAT04-14

Puissances frigorifiques — Refrigerating capacity — Capacidades frigoríficas — Capacidades frigorificas

FTEC01-03

NORME DI SICUREZZA

- queste apparecchiature sono destinate esclusivamente ad operatori professionalmente preparati che devono conoscere i fondamenti della refrigerazione, i sistemi frigoriferi, i gas refrigeranti e gli eventuali danni che possono provocare le apparecchiature in pressione.
- leggere attentamente il presente manuale che deve essere conservato per tutta la durata del compressore; la scrupolosa osservanza delle procedure illustrate è condizione essenziale per la sicurezza dell'operatore, l'integrità delle apparecchiature e la costanza delle prestazioni dichiarate.
- il compressore deve funzionare esclusivamente con fluidi refrigeranti indicati dal costruttore.
- durante le varie operazioni, evitare assolutamente di disperdere in ambiente il refrigerante; tale precauzione, oltre ad essere richiesta dalle norme internazionali a tutela dell'ambiente, è indispensabile al fine di evitare che la presenza di refrigerante in ambiente renda difficile la localizzazione delle eventuali perdite.
- non manomettere o modificare la taratura dei sistemi di sicurezza e di controllo.
- in nessun caso, introdurre ossigeno all'interno del compressore.
- verificare che le caratteristiche della rete elettrica di alimentazione siano adeguate alle caratteristiche del compressore.
- prima di alimentare elettricamente il compressore, verificare che i rubinetti di aspirazione e di compressione siano completamente aperti e che il coperchio della morsettiera sia stato sigillato.
- verificare sempre che il compressore sia collegato a una rete elettrica di alimentazione adeguatamente protetta e dotata di efficiente linea di messa a terra.
- rimuovere il coperchio della scatola terminale solo dopo aver interrotto l'alimentazione elettrica del compressore.
- non avviare il compressore quando al suo interno sussistono condizioni di alto vuoto.
- evitare di inalare i vapori di refrigerante.
- è consigliabile indossare adeguate protezioni quali occhiali e guanti; la bassa temperatura di ebollizione del refrigerante può provocare danni fisici all'operatore.
- evitare il contatto tra refrigerante e fiamme libere o superfici calde; alle alte temperature, il refrigerante si decompone liberando sostanze tossiche, dannose sia per l'ambiente che per l'operatore.
- il compressore viene fornito con una carica di tenuta di azoto alla pressione di 1 bar; rimuovere i bulloni del compressore solo dopo avere eliminato la carica di tenuta.
- toccare il compressore solo dopo un lungo periodo di inattività; durante il funzionamento, alcune sue parti possono raggiungere temperature superiori a 100°C e richiedono tempo per raffreddarsi.

SAFETY PRECAUTIONS

- only trained operators with knowledge of refrigeration fundamentals, cooling systems, refrigerants and the potential harm of handling pressurised equipment can work on system.
- read carefully the instructions in the literature, keep this pubblication for the whole service life of the compressor; strict observance of the procedures are essential for safety of the operator, mantaining declared performances and satisfactory operation.
- compressor must only operate with refrigerants indicated by manufacturer.
- during maintenance do not release refrigerants to the environment; this is not only required by international law for protecting the environment, but also to avoid difficulties in detecting leaks in a heavily polluted atmosphere.
- do not adjust safety valves and control settings.
- do not use oxygen to press test the compressor.
- verify that characteristics of electric power are suitable to compressor characteristics.
- before switching on the compressor check that the suction and discharge valves are fully open and that the terminal box cover is fitted.
- compressor must always be suitably connected to a protected and earthed power line.
- turn off the compressor and disconnect it from power line before removing the terminal box cover.
- do not start the compressor with the system in high vacuum condition.
- avoid breathing refrigerant vapour.
- wear safety glasses and gloves when handling refrigerant or performing maintenance procedures; avoid contact with refrigerant, blindness and injuries may result to operator.
- keep away from flames and hot surfaces; high temperature decomposes refrigerant releasing toxic contaminants which are very dangerous for environment and operator.
- compressor is supplied with a nitrogen holding charge with pressure 1 bar; remove compressor bolts only after the holding charge has been vented.
- do not touch the compressor until it has been inoperative for a long period; when operating temperatures can reach 100°C / 212°F and needs time to cool.

FTE001-03

1. Descrizione generale

FRASCOLD offre una moderna ed efficiente linea di prodotti per la refrigerazione e il condizionamento dell'aria tra i quali compressori semiermetici, di tipo alternativo monostadio.
Per maggiori dettagli, consultare il catalogo "Compressori semiermetici FRASCOLD".

1.1 La dotazione standard

Ogni compressore viene fornito completo di:
- carica di olio lubrificante
- carica di tenuta con azoto alla pressione manometrica di 1 bar
- supporti antivibranti in gomma
- dispositivo di protezione del motore elettrico
- scatola terminale completa di barrette a ponticello e dadi di bloccaggio
- kit di guarnizioni di ricambio per rubinetti di scarico e aspirazione, collocate all'interno della scatola terminale
- bollettino tecnico "Istruzioni per l'installazione e l'avviamento" inserito all'interno della scatola parti elettriche
- pressostato differenziale olio elettronico per i compressori serie V, Z, W

A richiesta, è possibile fornire il compressore equipaggiato con una vasta gamma di accessori idonei a garantire efficienza e affidabilità a tutte le condizioni di funzionamento previste.
Per maggiori dettagli, consultare i manuali di installazione relativi ai singoli accessori (vedi pagina 17, "7. Equipaggiamenti e accessori") .

1.2 La targhetta

Ogni compressore è dotato di targhetta metallica rivettata, sulla quale sono riportati indelebilmente tutti i dati caratteristici del compressore stesso.
Per maggiori dettagli, vedi figura 1.

1.3 La protezione

I compressori vengono forniti completi di protezione integrale, conforme alla norma DIN44081, costituita da una catena di termistori PTC inseriti nello statore del motore elettrico e collegati a un modulo elettronico di controllo KRIWAN (modello T00ECA01 per i compressori serie A, B, C, D, F, Q e S; modello T00ECA11 per i compressori serie V, Z e W.
Il modulo modello T00ECA11, è dotato di circuito di ritardo che permette l'avviamento del compressore solo dopo che sono trascorsi 5 minuti dal

1. Introduction

FRASCOLD offers a modern and high performance range of products for refrigeration and air-conditioning including single stage reciprocating semi-hermetic compressors.
For further details, please consult the catalogue "FRASCOLD semi-hermetic compressors".

1.1 Standard equipment

Each compressor is supplied complete with:
- oil charge
- nitrogen holding charge at 1 bar gauge pressure
- rubber vibration absorbers
- electric motor protection
- terminal box complete with staple bars and nuts
- spare parts set for discharge and suction valves, placed inside the terminal box
- technical leaflet "Installation and start-up instructions" placed inside the terminal box of the compressor
- electronic oil pressure switch, compressors of the series V, Z, W

Upon request, it is possible to supply the compressor equipped with a large range of accessories suitable to achieve better efficiency and reliability for any foreseen operational condition.
For further details, consult installation manuals concerning the individual accessories (see page 17, "7. Equipments and accessories") .

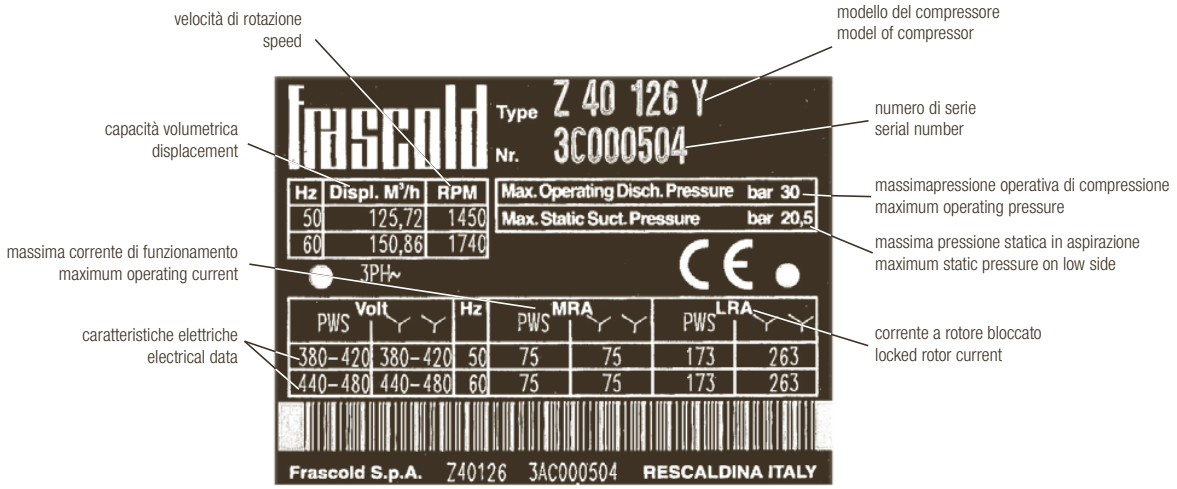
1.2 Name plate

Each compressor is equipped with a rivetted name plate, on which are indicated indelebly all compressor characteristic data.
For further details, see figure1.

1.3 Protection

Compressors A, B, C, D, Q, F, S, V, Z and W series are supplied with integral protection, in accordance to DIN44081 standard, with PTC thermistors placed into the electrical motor stator and connected to an electronic control module KRIWAN (model T00ECA01 for A, B, C, D, Q, F and S series compressors; model T00ECA11 for V, Z and W series compressors).
The module model T00ECA11 is equipped with 5 minute delay circuit that protects against "short cycling (see page 7, "1.10 Maximum stop/starts per hour" and "1.11 Application limits").

FTEC01-03



la targhetta - name plate
fig. 1

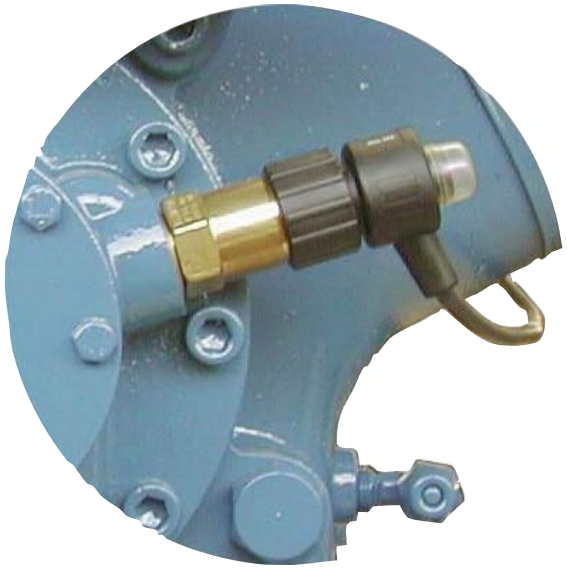
suo intervento, impedendo così una successione troppo frequente di avviamenti e arresti (vedi pagina 7, §1.10 I cicli di funzionamento e §1.11 Limiti di impiego).
L'equipaggiamento standard per i compressori serie V, Z e W è completo di un sensore di temperatura direttamente inserito sul lato compressione del compressore (vedi fig.2).
Tale accessorio a reinserzione automatica, tarato a 130°C e collegato in serie ai termistori PTC, arresta il funzionamento del compressore quando la temperatura di fine compressione raggiunge valori critici.
A richiesta, è possibile equipaggiare anche i compressori serie Q ed S con il sensore di massima temperatura di compressione.
Per il collegamento dei dispositivi di protezione, consultare il presente manuale a pagina 10 §3.3 Collegamenti elettrici e gli schemi elettrici menzionati al capitolo 11.

1.4 La scatola terminali

All'interno della scatola, sono alloggiati tutti i terminali per il collegamento del compressore alla rete di alimentazione elettrica e al circuito di controllo e protezione.
Il corpo della scatola è realizzato in un unico pezzo ed il coperchio è dotato di guarnizione tipo O-ring; grado di protezione IP55.
N.B. La scatola terminali contiene una serie completa di guarnizioni per i rubinetti di scarico e di aspirazione e il circuito di controllo del pressostato differenziale olio.
La morsettiera di alimentazione dei compressori trifase, è completa di barrette a ponticello e dadi di bloccaggio.
Per il collegamento elettrico del compressore, consultare il presente manuale a pagina 10 §3.3 Collegamenti elettrici e gli schemi riportati sul documento M041.

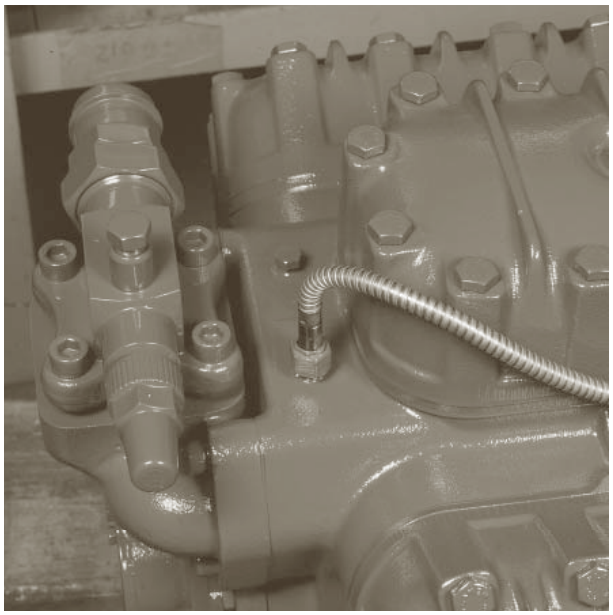
1.5 La lubrificazione

I compressori serie A, B, C, D, F, Q, e S sono lubrificati mediante disco centrifugatore dell'olio; nei compressori serie V, Z e W, la lubrificazione è garantita da una pompa ad alta pressione.
Tutti i compressori con pompa di lubrificazione sono dotati di filtro olio e attacchi per rilevare la pressione di mandata della pompa e di pressostato differenziale elettronico (vedi figura 3) per proteggere il compressore da danni causati da scarsa lubrificazione.



pressostato differenziale olio elettronico
electronic oil pressure switch
fig.3

Standard equipment of V, Z and W series compressors includes a maximum discharge temperature sensor (see fig. 2).
This accessory with automatic reset, it is connected in series with PTC thermistors and is calibrated at 130°C to stop compressor operating when the discharge temperature reachs that critical value.
Upon request, discharge temperature sensor can fits Q and S series compressors.



sensore di massima temperatura di compressione
maximum discharge temperature sensor
fig.2

As concern protection device connection, consult the present manual on page 10 §3.3 Electrical connections and the wiring diagrams on M041.

1.4 Terminal box

Inside the box, there are all the terminals for compressor connection to the electrical net and to the check and protection circuit.
The body of the box is manufactured as a single piece with the cover having a O-ring seal giving an enclosure rating of IP55.
N.B. The terminal box contains a complete gasket set for discharge and suction valves and the control circuit of oil pressuse switch.
The electric terminal box for three phase compressors are complete with staple bars and stop nuts.
As per compressor electrical connection, consult the present manual on page 10 §3.3 Electrical connections and the the wiring diagrams starting from page 60.

1.5 Lubrication

Compressors A, B, D, F, Q, and S series are lubricated by means oil thrower disc.
In compressors V, Z and W series, lubrication is achieved by high pressure oil pump.
All compressors with oil pump are complete with oil filter and connections for pump discharge pressure and oil differential pressure electronic switch to protect the compressor from damages caused by lack of lubrication.

FTE001-03

1.6 Il lubrificante

Tutti i compressori FRASCOLD vengono caricati in fabbrica con una adeguata quantità di lubrificante estere di polioli POE.
Il tipo di lubrificante e la sua viscosità sono commisurati sia al refrigerante che al campo delle temperature di evaporazione alle quali il compressore può operare; per maggiori dettagli, vedere FTEC27.
Ogni sostituzione del lubrificante o eventuale reintegro della carica, deve assolutamente essere effettuata con lo stesso tipo di olio contenuto originariamente oppure di tipo approvato dalla FRASCOLD e seguendo scrupolosamente la procedura illustrata a pagina 21, «9.1 Sostituzione del lubrificante».

1.7 I rubinetti di compressione e aspirazione

Il compressore viene fornito con i rubinetti di compressione e di aspirazione già montati sul compressore e completi di guarnizioni.
Nel caso fosse necessario smontare i rubinetti dal corpo del compressore (per esempio, prima della saldatura dei tubi del circuito frigorifero), le guarnizioni devono essere rimosse e successivamente sostituite con quelle fornite a corredo e poste all'interno della scatola terminale.
Il collegamento dei rubinetti ai tubi del circuito frigorifero deve essere eseguito seguendo la procedura illustrata a pagina 9, «3.2 Collegamenti frigoriferi».

1.8 I supporti antivibranti

Ogni compressore viene fornito completo di quattro supporti antivibranti in gomma, uguali tra loro e confezionati separatamente con la minuteria necessaria per il loro montaggio.
Il montaggio deve essere eseguito seguendo le istruzioni illustrate a pagina 8, «3.1 Fissaggio del compressore al basamento».

1.9 La carica di tenuta

Al termine del collaudo in linea, il compressore viene pressurizzato con azoto alla pressione manometrica di 1 bar.
Tale carica di tenuta, che ha lo scopo di impedire infiltrazioni di umidità all'interno del compressore durante il trasporto e lo stoccaggio, deve essere rimossa prima delle operazioni di carica del refrigerante nel circuito

ATTENZIONE

Prima di rimuovere qualsiasi vite o rubinetto del compressore, eliminare la carica di tenuta allentando lentamente il dado cieco del rubinetto di compressione.

1.10 I cicli di funzionamento

Una successione troppo frequente di avviamenti e arresti del compressore è causa di notevoli sollecitazioni meccaniche e surriscaldamento del motore elettrico che riducono sensibilmente la vita operativa del compressore.
Tale inconveniente potrebbe derivare dall'avere scelto un compressore troppo potente rispetto al carico termico o da un termostato di regolazione con un differenziale troppo piccolo.

1.11 Limiti di impiego

Sbilanciamento della corrente tra due fasi	10%
Sbilanciamento della tensione tra due fasi	2%
Tolleranza sulla tensione nominale	±5%
Numero di cicli *	10/ora
Pressione statica sul lato di bassa pressione	20.5 bar
Pressione operativa sul lato di alta pressione	30 bar
Temperatura di scarico	130°C

* con almeno 5 minuti di funzionamento continuo
Tali valori sono da considerare limiti da non superare in qualsiasi condizione operativa.

1.6 Lubricant

All FRASCOLD compressors are charged in the factory with an adequate quantity of POE polyol ester lubricant.
The lubricant type and its viscosity are fitted both to refrigerant and to evaporating temperatures field at which the compressor may work.
For further details, consult FTEC27.
Each lubricant replacement or eventual charge recovery have to be absolutely effected with the same oil type originally contained or with a type approved by FRASCOLD and following strictly the procedure illustrated on page 21, «9.1 Lubricant replacement».

1.7 Discharge and suction valves

The compressor is supplied with discharge and suction valves already assembled on the compressor and complete with gaskets.
In case it is necessary to disassemble the valves from compressor body (for example before refrigerating circuit pipes welding), the gaskets have to be removed and then replaced with those supplied as spares and placed inside the terminal board.
The valve connection to the refrigerating circuit pipes has to be executed following the procedure illustrated on page 9, «3.2 Refrigerating connections».

1.8 Vibration absorbers

Each compressor is supplied complete with four rubber vibration absorbers, all equal and packed separately with the necessary small parts for their assembling.
The assembly has to be executed following the instructions illustrated on page 9, «3.1 Compressor fixing to frame».

1.9 Holding charge

At the end of the test on-line, the compressor is pressurized with nitrogen at 1 bar gauge; this holding charge has the purpose to avoid humidity infiltrations inside the compressor during transport and stockage.

WARNING

Before removing any compressor bolt or valve, vent the holding charge by opening slowly the discharge valve

1.10 Maximum stop/start per hour

A too frequent sequence of compressor start and stop causes of many mechanical stresses and electrical motor overheating, which reduce considerably the compressor lifetime.
This inconvenience could have a source in the choice of a too powerful compressor with respect to the thermal charge or of a regulation thermostat with a too small differential.

1.11 Application limits

Current unbalance between two phases	10%
Tension unbalance between two phases	2%
Tolerance on nominal tension	±5%
Cycle number *	10/hour
Static pressure on low pressure side	20.5 bar
Working pressure on high pressure side	30 bar
Discharge temperature	130°C

* with 5 min. of minimum continuous running

These values are to be considered as limits not to exceed in every working condition.

2. Controlli, operazioni preliminari prima della installazione

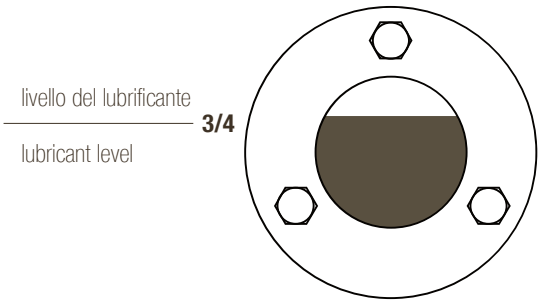
Una volta ricevuto il compressore e prima di procedere alla sua installazione, eseguire alcune semplici operazioni allo scopo di verificarne la sua integrità e idoneità al montaggio nel circuito frigorifero.

2.1 Controlli e verifiche

a) al momento del ricevimento del compressore, verificare che il suo imballo non abbia subito danni durante il trasporto
b) rimuovere l'imballo del compressore
c) verificare che il compressore non sia danneggiato

N.B. Nel caso venissero riscontrati danni o manomissioni, inviare tempestivamente una segnalazione scritta.

d) verificare che la dotazione di componenti forniti a corredo del compressore sia completa così come illustrato a pagina 5 "1.1 La dotazione standard"
e) adagiare su un piano orizzontale il compressore e verificare che il livello del lubrificante sia sempre superiore a 3/4 della spia di livello (vedi figura 4)



livello dell'olio - oil level
fig. 4

f) verificare che le caratteristiche elettriche riportate sulla targhetta del compressore (vedi figura 1, pagina 5) siano compatibili con i valori della rete di alimentazione

2.2 Il sollevamento del compressore

Tutti i compressori sono dotati di una apposita asola o anello di sollevamento (vedi figura 5).
Gli strumenti utilizzati per il sollevamento (ganci, corde, etc) devono avere caratteristiche di resistenza compatibili con i pesi dei compressori.
Non sollevare il compressore agganciandolo ai rubinetti di servizio o altri accessori, per evitare danni permanenti al compressore e/o perdite di refrigerante.
Durante il sollevamento, tenere fermo il compressore per evitare le oscillazioni.

2. Preliminary checks and operations before installation

Upon compressor receipt and before its installation, execute some easy operations in order to verify its integrity and fitness for assembly in the refrigerating circuit.

2.1 Checks and testings

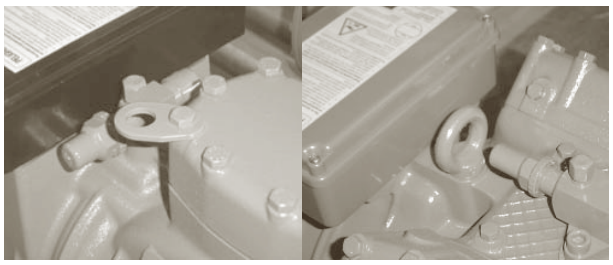
a) at compressor receipt, verify that its packing has not been damaged during transport
b) remove compressor packing
c) verify that the compressor is not damaged

N.B. In case damage or tampering found, send immediately a written communication.

d) verify that the components supplied as compressor equipment are complete as illustrated on page 5 "1.1 Standard equipment"
e) put the compressor on a horizontal surface and verify that the lubricant
level is not lower than 3/4 of level sight glass (see figure 4)
f) verify that the electrical characteristics on the compressor name plate (see figure 1, page 5) are in accordance with the electrical net values.

2.2 Compressor lifting

All compressors are equipped with a suitable lifting slot or ring placed between the heads and the terminal board.
Compressors should only be moved with equipments suitable for the weight involved.



sollevamento del compressore - compressor lifting
fig.5

Never lift the compressor, hooking suction and discharge valves as well other accessories to avoid damages and refrigerant leakages.
During lifting, keep the compressor still to avoid oscillations.

FTE001-03

3. Installazione del compressore

3.1 Fissaggio del compressore al basamento

È importante che il compressore venga fissato a un basamento perfettamente orizzontale che, oltre a garantire un funzionamento privo di anomale sollecitazioni, è indispensabile per la perfetta lubrificazione delle parti in movimento.

L'impiego dei supporti antivibranti forniti a corredo impedisce alle vibrazioni, che si manifestano durante il funzionamento, l'arresto e l'avviamento, di venire trasmesse al basamento sul quale il compressore è montato.

a) allestire il posto di installazione del compressore rispettando gli spazi tecnici necessari così come indicato nei disegni dimensionali

b) mediante i quattro supporti intivibranti forniti a corredo, fissare il compressore al posto di installazione, applicando ai dadi la coppia di serraggio qui di seguito riportata.

Supporti antivibranti - coppia di serraggio dei dadi			
dimensioni del dado		M8	M10
serraggio	Nm	20	30

3.2 Collegamenti frigoriferi

ATTENZIONE

Prima di rimuovere qualsiasi vite o rubinetto del compressore, eliminare la carica di tenuta allentando lentamente il dado cieco del rubinetto di compressione.

La realizzazione dei collegamenti frigoriferi del compressore richiede interventi di brasatura dei rubinetti di aspirazione e di compressione; la affidabilità di un circuito frigorifero è condizionata dalla quantità di prodotti estranei al lubrificante e al refrigerante presenti all'interno del circuito stesso. Mentre aria atmosferica e umidità (inevitabilmente infiltrati durante il montaggio) possono essere rimossi attraverso la vuotatura (vedi pagina 13, "5. Il vuoto e la carica di refrigerante"), l'estrazione dei residui del disossidante e gli ossidi che si formano durante la brasatura è una operazione nè semplice nè economica.

Le dimensioni delle impurità sono talmente ridotte da sfuggire in parte alla azione dei filtri installati sulla linea del liquido; durante l'assemblaggio del circuito frigorifero, è consigliabile adottare tutte le precauzioni possibili atte ad evitare l'introduzione di impurità.

Oltre alle elementari precauzioni da mettere in atto durante il taglio del tubo, è necessario evitare un uso esagerato di disossidanti e, quando possibile, immettere azoto secco o altro gas inerte nella tubazione durante la sua brasatura; per evitare di esporre le parti interne del rubinetto a un pericoloso surriscaldamento, si consiglia di smontare il rubinetto o il solo manicotto (rimuovendone le guarnizioni) e avvolgerlo in un panno bagnato.

a) allentare lentamente il dado cieco del rubinetto di compressione e lasciare sfiatare la carica di tenuta di azoto
b) al termine della operazione serrare accuratamente il dado cieco
c) smontare i rubinetti (o i manicotti) dal compressore (vedi figura 6)
d) rimuovere le guarnizioni (vedi figura 7)
e) procedere alla brasatura dei rubinetti alle tubazioni di compressione e aspirazione del circuito frigorifero, adottando le precauzioni necessarie ad evitare sia il surriscaldamento delle parti interne che l'introduzione di prodotti estranei
f) sostituire le guarnizioni precedentemente rimosse con quelle fornite a corredo poste all'interno della scatola terminale
g) rimontare i rubinetti (o i manicotti) applicando alle viti la coppia di serraggio qui di seguito riportata

Rubinetti - coppie di serraggio delle viti					
dimensione della vite		M8	M10	M12	M16
serraggio	Nm	32	48	64	112

3. Compressor installation

3.1 Compressor fixing to frame

It is important that the compressor is fixed to a frame perfectly horizontal that, as well as guarantees working without anomalous stresses, is indispensable for the perfect lubrication of parts in motion.

The vibration absorbers supplied will reduce operational and stop/start vibrations being transmitted to the compressor frame to which it is fitted.

a) prepare the compressor installation seat, respecting the necessary technical space as indicated on drawings
b) through the four vibration absorbers supplied as equipment, fix the compressor on installation seat, applying the correct tightening torque, as below.

Vibration absorbers - bolt tightening torque			
bolt dimension		M8	M10
tightening torque	Nm	20	30

3.2 Refrigerating connections

WARNING

Before removing any compressor bolt or valve, discharge the holding charge by opening slowly the discharge valve plug.

The compressor refrigerating connections realization require suction and discharge valve brazing operations; the refrigeration system's reliability will be reduced if foreign particles are allowed into the circuit.

While atmospherical air and humidity (infiltrated inevitably during assembly) can be removed through vacuum (see page 13, "5. Vacuum and charge"), the removal of the deoxidizer and oxide residual, which develops during brazing, is an operation neither simple nor cheap.

The impurity dimensions are so small to bypass partly the action of filters installed in liquid lines; during refrigerating circuit assembly, it is advisable to use all possible precautions in order to avoid impurity introduction.

Besides to elementary precautions to take during pipe cutting, it is necessary to avoid an excessive use of deoxidizers and, when possible,to put dry nitrogen or other inert gas in the piping during its brazing;to avoid to offer valve internalparts at a dangerous overheating,it is suggested to disassemble the valve or only the coupling (by removing the gaskets) and wrap it in a wet cloth.

a) open slowly the compressor suction valve plug and vent the nitrogen holding charge
b) close carefully the plug
c) disassemble the valves (or coupling) from the compressor (see figure 6)
d) remove the gaskets (see figure 7)

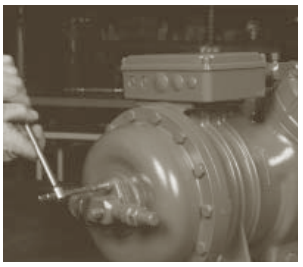


fig. 6

fig. 7

e) effect the brazing of the valves of the discharge and suction pipes of the refrigerating circuit, taking necessary precautions to avoid both internal part overheating and foreign product introduction
f) replace the gaskets previously removed, with those supplied as spares

FTEC01-03

Prima di procedere nelle operazioni di installazione, si consiglia di predisporre il compressore per il collegamento dei dispositivi di sicurezza e controllo quali pressostati e manometri, oppure per gli interventi di reintegro della carica di olio.
Il corpo del compressore è dotato di attacchi filettati femmina con tappo di chiusura; la rimozione di alcuni tappi (vedi figura 8) e la loro sostituzione con semplici nipli o, meglio ancora, con valvole di servizio di tipo Schrader (vedi figura 9), metterà a disposizione dell'operatore le necessarie prese di pressione per i collegamenti ai vari dispositivi di controllo e sicurezza.

ATTENZIONE

Non collegare alcun dispositivo di sicurezza e controllo agli attacchi presenti sui rubinetti di aspirazione e di compressione; questi vengono esclusi quando il rubinetto è completamente aperto (intercettazione in retrochiusura).

fig. 8

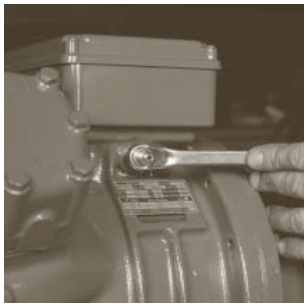

fig. 9

Per identificare i possibili impieghi degli attacchi, fare riferimento ai disegni riportati sui cataloghi.
Per la scelta e il montaggio di equipaggiamenti secondari e/o accessori quali pressostati, termostati, manometri, separatore di olio, etc. si consiglia di prendere visione di quanto riportato a pagina 18, "8. Accessori vari".

3.3 Collegamenti elettrici e del pressostato olio

I collegamenti elettrici devono essere eseguiti in accordo con gli schemi elettrici allegati al presente manuale e nel rispetto delle norme di sicurezza in vigore nel luogo di installazione.
Le norme attualmente in vigore nella Comunità Europea e alle quali è necessario fare riferimento sono EN60204 (Equipaggiamenti elettrici per macchine industriali - Requisiti generali) e EN60355 (Sicurezza degli apparecchi elettrici di uso domestico o similari - Requisiti particolari per i motocompressori).
Per il corretto collegamento del compressore, consultare lo schema elettrico applicato nella parte interna del coperchio della scatola terminali oppure lo schema elettrico e comunque prendere visione di quanto riportato a pagina 12, "4, Avviamento del compressore".

ATTENZIONE

I collegamenti elettrici devono essere eseguiti esclusivamente da personale specializzato.

a) rimuovere il coperchio della scatola terminali
b) posizionare le barrette a ponticello seguendo le indicazioni riportate sul documento M041.

ATTENZIONE

L'errato collegamento elettrico può dare luogo a cortocircuito o collegamenti in contro fase (nel caso di avviamento frazionato PWS) e causare la bruciatura del motore.

c) inserire negli appositi fori della scatola terminali degli idonei pressacavi PG per assicurare il grado di protezione originale della scatola stessa
d) collegare la rete di alimentazione alla morsettiera, utilizzando cavi elettrici isolati e capicorda a occhiello per i terminali
e) applicare ai dadi la seguente coppia di serraggio

Morsettiera - coppia di serraggio

bullone		M4	M6
coppia di serraggio	Nm	4	10

placed inside the terminal box
g) re-assemble the valves (or coupling), applying the following tightening torque

Valves - bolt tightening torque

bolt dimension		M8	M10	M12	M16
tightening torque	Nm	32	48	64	112

Before proceeding to installation operations, it is suggested to arrange the compressor for safety and check devices connection, like pressure switches and manometers, or for oil charge fulfilment interventions.
The compressor body is equipped with different female threaded connections with closing plug; the removal of some plugs (see figure 8) and their replacement with a niple or, better, a Schrader service valves (see figure 9), will put at operator's disposal the necessary pressure connections for various safety and check devices.

WARNING

Do not connect any safety and check device to the connections placed on suction and discharge valves, because they are closed off when the valve is completely open (interception in retroclosing).

See drawings on catalogues for description of their possible use.
For the selection and assembly of secondary equipments and/or accessories like pressure switches, thermostats, manometers, oil separators, etc. it is suggested to look at paragraph on page 18, "8. Various accessories".

3.3 Oil pressure switch and electrical connections

Electrical connections have to be executed in accordance with the wiring diagrams enclosed to the present manual and in observance of installation place safety regulations.
Regulations presently in force in EC and to which it is necessary make reference, are EN60204 (Electrical equipments for industrial machines - General requirements) and EN60355 (Electrical instrument safety for domestic use or similar - Particular requirements for motocompressors).
For the right compressor connection, look at the electrical scheme placed in the inside of terminal box cover or the electrical scheme.

WARNING

Electrical connections have to be executed only by skilled operators.

a) remove the terminal box cover
b) replace the staple bars following the indications of document M041

WARNING

The incorrect electrical connections may cause short circuit or counter phase connections and therefore the motor burn-out.

c) put in the terminal box holes some suitable PG cable-presses to assure the box's original protection grade
d) connect the feeding net to the teminal box, using suitable insulated electrical cable and eyelet cable terminals fitted to terminals
e) apply to nuts the following tightening torque

Terminal box - bolt tightening torque

bolt dimension		M4	M6
tightening torque	Nm	4	10

FTE001-03

d) collegare la rete di alimentazione alla morsettiera utilizzando idoneo cavo elettrico isolato e capicorda ad occhiello adatti ai terminali
e) applicare ai dadi la coppia di serraggio qui di seguito riportata

Scatola terminali - coppia di serraggio dei dadi			
dimensioni dei dadi		M4	M6
serraggio	Nm	4	10

f) rimuovere il coperchio del dispositivo di protezione
g) collegare il dispositivo al circuito elettrico di controllo seguendo quanto
indicato nello schema elettrico e rimontare il coperchio

ATTENZIONE

Non alimentare direttamente i terminali A e B collegati ai termistori PTC.

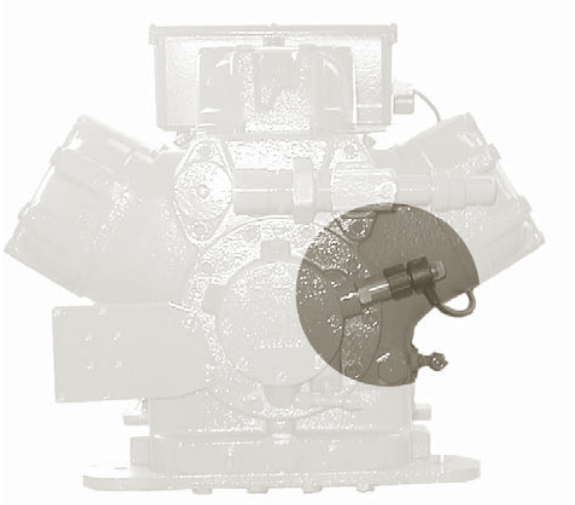
h) prelevare il circuito di controllo del pressostato dalla scatola elettrica del compressore
i) inserire il circuito di controllo nel sensore e serrare a mano la ghiera girevole dopo averne rimosso il suo cappuccio in plastica
l) collegare elettricamente il pressostato differenziale, seguendo lo schema elettrico.
m) rimontare il coperchio sulla scatola terminali

N.B. Equipaggiare il compressore con riscaldatore olio carter e collegarlo in modo da poter essere alimentato manualmente almeno 2 ore prima dell'avviamento successivo a un lungo periodo di inattività e, durante il normale funzionamento, solo a compressore fermo.

3.4 Selezione del teleruttore, dei fusibili e dei cavi

La selezione di idonei teleruttori, fusibili e cavi, deve soddisfare quanto richiesto dalla norma EN60204 (Equipaggiamenti elettrici per macchine industriali - Requisiti generali) facendo riferimento ai valori di massima corrente di funzionamento MRA riportati sulla targhetta del compressore (vedi pagina 5, "1.2 La targhetta") e di massima potenza assorbita.

N.B. La potenza nominale del compressore non è equivalente alla potenza massima del suo motore elettrico.



pompa di lubrificazione con pressostato differenziale olio elettronico
oil pump with electronic oil pressure switch
fig. 10

f) after removing its cover, connect the protection device to check and protection circuit, following the electrical scheme

WARNING

Do not power directly terminals A and B connected to PTC thermistors.

g) reassemble the protection device cover
h) take the control circuit off the electric box of the compressor
i) remove the plastic cap from the sensor then put the control circuit into the sensor and close tightly by hand the screwcap
l) connect the oil pressure switch in accordance with the wiring diagram

m) reassemble the cover of the terminal box

N.B. Complete the compressor with oil crankcase heater and connect it so that it can be feed manually at least 2 hours before starting after a long period of inactivity and, during the normal working, only with the compressor not running.

3.4 Contactor, fuse and cable selection

The suitable remote control switch, fuse and cable selection has to satisfy what requested from EN60204 regulation (Electrical equipments for industrial machines - General requirements), with reference to MRA maximum operating current values reported on the compressor name plate (see page 5, "1.2 Name plate") and maximum input power.

N.B. The compressor nominal power is not equivalent to the maximum input power of its electrical motor.

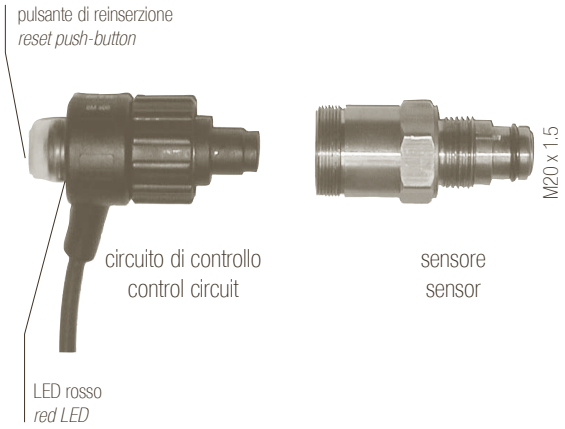


fig. 11

FTEC01-03

4. Avviamento del compressore

4.1 Avviamento diretto DOL (Direct On Line) - monofase

I motori monofase sono di tipo CSR (Capacitor Start Run - avviamento e marcia capacitivi) e si avvalgono di due distinti avvolgimenti, uno di marcia (terminali U-W) e uno di avviamento (terminali U-V).
La dotazione standard del compressore monofase comprende una scatola parti elettriche all'interno della quale sono alloggiate i seguenti componenti già tra loro cablati:

- condensatore di marcia
- condensatore di avviamento
- relay di avviamento

Per il suo funzionamento, il compressore deve essere collegato secondo lo schema elettrico.

4.2 Avviamento diretto DOL (Direct On Line) - trifase

Questo tipo di motore è adatto esclusivamente per avviamento diretto.
Posizionando opportunamente le barrette a ponticello, il compressore può funzionare con alimentazione 230V oppure 400V e precisamente:

- collegamento Δ; alimentazione 230V, avviamento diretto
- collegamento 人; alimentazione 400V, avviamento diretto

Gli schemi di collegamento sono riportati sul documento M041.

4.3 Avviamento frazionato PWS (Part Winding Start)

L'avviamento frazionato PWS del motore del compressore permette una sensibile riduzione della corrente di spunto rispetto a quella di un avviamento diretto.
Il motore elettrico con avviamento frazionato PWS è formato da due avvolgimenti completamente separati, tra loro uguali ($^1/_2 \div ^1/_2$) e che operano in parallelo.
Durante il normale funzionamento del compressore, la corrente assorbita da ogni avvolgimento è solo la metà della corrente totale assorbita dal motore.
Con il motore con avviamento frazionato PWS è possibile alimentare i due avvolgimenti indipendentemente e in tempi successivi; questo si ottiene equipaggiando la linea di alimentazione del primo avvolgimento con un normale teleruttore tripolare, la linea di alimentazione del secondo avvolgimento con un teleruttore tripolare e relay temporizzato.
Al momento dell'avvio del compressore, la chiusura istantanea dei contatti del primo teleruttore consente l'alimentazione del primo avvolgimento, con la chiusura ritardata dei contatti del secondo teleruttore si ottiene l'alimentazione del secondo avvolgimento e quindi dell'intero motore elettrico.
Rispetto ai motori PWS con avvolgimenti frazionati in diversi rapporti, i motori con rapporto $^1/_2 \div ^1/_2$ hanno i seguenti vantaggi:

- l'operatore può utilizzare indifferentemente l'uno o l'altro quale primo avvolgimento evitando così ogni possibile errore nell'identificare l'avvolgimento primario
- i due teleruttori necessari per l'avviamento devono avere caratteristiche
  identiche con indubbio vantaggio per la gestione dei ricambi

Il relay temporizzato del secondo teleruttore deve essere tarato per un tempo di ritardo di 0.5÷1 secondo.

N.B. Al fine di evitare danni al motore elettrico, il collegamento tra L1, L2 e L3 della linea di alimentazione elettrica e la morsettiera del compressore deve essere eseguita in modo tale da evitare campi magnetici contrapposti; per esempio la linea che viene collegata al morsetto Z deve essere la stessa collegata al morsetto U, lo stesso vale per le coppie di morsetti X-V e Y-W (vedi fig. 12).

4. Compressor starting

4.1 Direct On Line (DOL) start - single phase

Single phase motors are of CSR type (Capacitor Start Run) with two distinct windings, one for compressor running (terminals U-W) and another one for compressor start (terminals U-V).
Standard equipment for single phase compressor includes a box for electrical components with inside the following parts already cabled:

- run capacitor
- start capacitor
- start relay

For a correct running, compressor must be connected in accordance with the wiring diagram.

4.2 Direct On Line (DOL) start - three phase

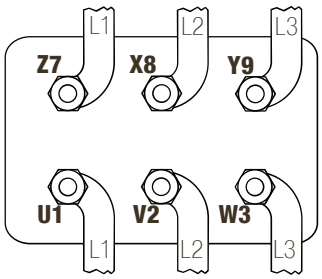
This type of motor is suitable for direct on line start only.
Placing the staple bars suitably, the compressor can be supplied with 230V voltage or 400V voltage, in detail:

- connection Δ; supply 230V, direct on line start
- connection 人; supply 400V, direct on line start

Wiring diagrams for direct on line starting of three phase compressors are reproduced on document M041.

4.3 Part Winding Start (PWS)

The starting of the compressor equipped with a PWS electric motor is distinguished by a lower starting torque than the one of direct on line start motor.
The electric motor with part winding start is of two distinct windings, equivalent partition ($^1/_2 \div ^1/_2$) operating in parallel.
During normal operation of the compressor, the input current by each single winding is only half of the total input current of the whole motor.
With the part winding start motor it is possible to power the two windings indipendently and in different time.



esempio di collegamento PWS - PWS connection example
fig. 12

This is possible by means the installation of a couple of regular three-pole contactors, one on the supply of the first winding and the second on the supply of the second winding; the latter has to be completed with a delayed relay.
Just as the compressor is powered, the closing of the contacts of the first contactor gives power to the first winding, with the delayed contact closing of the second contactor the electric motor is fully powered and the motor starting takes place.
Compared to the part winding start motor with different partition, the motor with $^1/_2 \div ^1/_2$ winding partition are distinguished with following advantages:

- without distinction, operator can use one of the two as first winding; in
  this way it is avoided any mistake in first winding identification
- real advantage in spare parts stock management results because the

FTE001-03

Il compressore con avviamento PWS può essere collegato per avviamento diretto posizionando le barrette a ponticello secondo i disegni riportati sul documento M041.

4.4 Avviamento 人 / Δ (stella/triangolo)

Nel motore elettrico con avviamento 人 / Δ (stella/triangolo) i tre avvolgimenti fanno capo ai sei terminali della morsettiera del compressore.
Per l'avviamento, il collegamento linea di alimentazione/motore avviene in due fasi; prima gli avvolgimenti devono essere collegati a 人 poi a Δ, modificando i ponti tra i vari morsetti.
A tale scopo è necessario utilizzare un teleruttore 人 / Δ che, una volta inserito, provvede autonomamente a commutare i ponti tra i vari morsetti fino al completo avviamento del motore del compressore.
Il ritardo alla commutazione del teleruttore 人 / Δ deve essere tarato a un valore pari a 1÷2 secondi.
Per il collegamento elettrico dei compressori con avviamento 人 / Δ consultare gli schemi riportati sul documento M041.
Il compressore con avviamento 人 / Δ può essere collegato per avviamento diretto posizionando le barrette a ponticello secondo i disegni riportati sul documento M041.

equal characteristics of the two required contactors
The delayed relay for the second contactor has to to be set with a time delay of 0.5÷1 second.
N.B. To save the electric motor from damages due to opposing magnetic fields, linkage between L1, L2 and L3 of power line and terminals of the compressor must be done with the care to connect the same line to the terminals Z and U; the same procedure must be applied for the couples of terminal X-V and Y-W (see fig.12)

By positioning of the staple bars as per the drawings on document M041, it is allowed the direct on line start of the compressor.

4.4 Star-delta (人 / Δ) start

The 人 / Δ (star/delta) start motor has the three wirings leading to the six terminals. For compressor starting, the six terminals are connected first 人 then Δ by means the changing of terminal connection.
To perform this changing, it is necessary a 人 / Δ start contactor that automatically switch the connections of the terminals until the complete compressor starting.
The time delay of the contactor between switching must be set to 1÷2 seconds.
Refer to the wiring diagrams on document M041 for 人 / Δ start of the compressor.
By positioning of the staple bars as per the drawings of document M041, it is allowed the direct on line start of the compressor.

FTEC01-03

5. Il vuoto e la carica di refrigerante

Una volta ultimato l'assemblaggio del circuito frigorifero, è necessario procedere alla sua evacuazione e successiva carica con refrigerante; il buon esito di queste due operazioni, condizione essenziale per il buon funzionamento del circuito frigorifero, è determinato dalla assoluta assenza di perdite nel circuito stesso.
Molti sono i metodi e i mezzi utilizzabili per la verifica della tenuta del circuito frigorifero; il più semplice e che dà sufficienti garanzie di affidabilità è articolato in due fasi; la prima da attuarsi al termine della evacuazione con lo scopo di individuare tutte quelle perdite che si manifestano in condizioni di vuoto, la seconda da attuarsi dopo le operazioni di carica per individuare le perdite che si manifestano quando il circuito è in pressione.
A tale proposito leggere attentamente il presente manuale a pagina 13 al punto "5.2 Prova di tenuta in vuoto" e a pagina 14 , "5.4 Ricerca delle fughe di refrigerante".

5.1 L'evacuazione del circuito frigorifero

Prima di effettuare la carica di refrigerante, è indispensabile estrarre dal circuito frigorifero i residui dei gas tecnici utilizzati per la pressatura, l'aria atmosferica, il vapore d'acqua ed eventuali frazioni d'acqua condensate all'interno durante il montaggio del circuito.
Grazie alle basse pressioni residue ottenibili, l'unico mezzo che garantisce una efficace vuotatura è la pompa per vuoto possibilmente del tipo a doppio stadio.
Un vacuometro elettronico collegato alla bocca di aspirazione della pompa, permetterà di verificare il grado di vuoto raggiunto (o pressione residua) e in seguito eseguire il controllo della tenuta in vuoto del circuito.

5. Vacuum and refrigerant charge

After completing the refrigerating circuit, it is necessary to effect its evacuation and following charge with refrigerant.
The successful completion of these two operations are essential for satisfactory operation of the system and total elimination of refrigerant leaks to the environment.
Many methods are available to eliminate leaks in the circuit.
The simplest one that grants sufficient reliability warranties is composed by two phases.
The first one to be executed at the end of circuit evacuation operation checking all the leaks that occur in vacuum condition; the second one to be executed after charge operation to check the leaks that occur when the circuit is under pressure.
On this regard read carefully the present manual at paragraph "5.2 Sealing proof in vacuum" and "5.4 Refrigerant leak detection".

5.1 Refrigerating circuit evacuation

Before effecting the refrigerant charge, it is essential to remove from the refrigerating circuit the gas residuals used for pressure testing, the atmospherical air, the water vapour and eventual water fractions internally condensed during circuit assembly.
Thanks to residual low pressures that can be obtained, the only way that grants an efficient vacuum, is two stage vacuum pump..
An electronic vacuometer connected to the pump suction side, will allow to verify the obtained vacuum level (or residual pressure) and then to effect the check of circuit vacuum sealing.
To obtain an acceptable vacuum degree in reasonably short times, it is

Per ottenere un accettabile grado di vuoto in tempi ragionevolmente contenuti, si consiglia di collegare alla pompa per vuoto sia il lato di alta pressione che quello di bassa pressione del circuito frigorifero.
Le tubazioni flessibili utilizzate per il collegamento alla pompa per il vuoto, devono essere le più corte possibili e con una sezione di passaggio pari alla sezione dell'attacco di aspirazione della pompa stessa.

ATTENZIONE

Durante l'intero periodo di evacuazione, tutti i rubinetti del compressore e ogni altra valvola del circuito frigorifero devono essere completamente aperti.

Una volta raggiunto un grado di vuoto pari ad almeno 0.2 mbar, continuare ad evacuare il circuito mantenendolo in queste condizioni per un tempo commisurato al suo volume interno.
Al termine del periodo di evacuazione, spegnere la pompa solo dopo averne chiuso il rubinetto posto sulla linea di aspirazione della pompa stessa.

ATTENZIONE

Non avviare il compressore in condizioni di alto vuoto.

5.2 Prova di tenuta in vuoto

Ultimata l'evacuazione del circuito frigorifero, è possibile eseguire un primo controllo della sua tenuta, verificando la eventuale presenza delle perdite che si manifestano in condizioni di vuoto.
Dopo lo spegnimento della pompa per vuoto, l'operatore deve leggere il vacuometro collegato alla bocca di aspirazione della pompa e registrare il valore di pressione residua indicato, attendere almeno 5 minuti e verificare se la pressione residua indicata è aumentata a causa di infiltrazioni di aria.
In tale caso, è necessario individuare i punti di infiltrazione, sigillarli, ripetere le operazioni di evacuazione e, per maggiore sicurezza, anche la prova di tenuta in vuoto.

5.3 La carica di refrigerante

La carica di refrigerante deve essere effettuata immettendo refrigerante in forma liquida nel lato di alta pressione del circuito e utilizzando tubi flessibili preventivamente evacuati così da evitare l'introduzione di gas incondensabili.
Nel caso in cui la bombola utilizzata per la carica fosse priva di pescante, è altamente raccomandabile l'uso di un idoneo filtro deidratore installato tra la bombola e l'attacco di ingresso del refrigerante nel circuito frigorifero.
Tale precauzione eviterà che eventuali impurità contenute nella bombola o nei tubi flessibili, vengano trascinate all'interno del circuito stesso.
Si consiglia di alimentare la resistenza di riscaldamento del carter prima di iniziare le operazioni di carica, così da impedire la condensazione del refrigerante nel lubrificante.
La carica dal lato di alta pressione, evita che il refrigerante allo stato liquido raggiunga il carter del compressore diluendone il lubrificante contenuto al suo interno.
Il refrigerante liquido immesso, provoca la chiusura delle valvole di scarico del compressore (che agiscono così come valvole di ritegno), si espande attraverso la valvola termostatica e raggiunge il lato di aspirazione del compressore in forma di vapore.
Le operazioni di carica saranno tanto più rapide quanto maggiore sarà la temperatura (e quindi la pressione) del refrigerante contenuto nella bombola; per problemi di sicurezza, la temperatura della bombola non deve mai essere superiore a +40°C.
Per mantenerne costante la temperatura durante la carica, si consiglia di immergere la bombola in un recipiente contenente acqua calda oppure utilizzare una apposita resistenza riscaldante termostatata a fascia.
Per nessuna ragione la bombola deve essere riscaldata con il cannello di saldatura o altri mezzi a fiamma.

suggested to connect to the vacuum pump both the refrigerating circuit high pressure side and the low pressure side.
The flexible pipes used for vacuum pump connection, have to be as short as possible and with thesame diameter of the pump's suction connection.

WARNING

During the whole evacuation period, all compressor valves and each other refrigerating circuit valve must be completely open.

After reaching a vacuum degree equal at least to 0,2 mbar, continue evacuation the circuit keeping it in these conditions for a time that depends from its internal volume.
At the end of the evacuating period, switch off the vacuum pump only after closing the suction valve.

WARNING

Do not start the compressor in high vacuum conditions.

5.2 Sealing proof in vacuum

After completing the refrigerating circuit evacuation, it is possible to check its seal, veryfing the eventual leakages that occurs under vacuum conditions.
After switching off the vacuum pump, the operator has to read the vacuometer connected to the pump suction side and record the indicated residual pressure value, wait at least 5 minutes and verify if the indicated residual pressure is increased due to air infiltrations.
In this case it is necessary to find the infiltration points, seal them, repeat the venting operations and, for higher safety, also the sealing proof in vacuum.

5.3 Refrigerant charge

The refrigerant charge has be to executed, introducing liquid refrigerant in the circuit high pressure side and using flexible hoses previously evacuated in order to avoid uncondensable gas introduction.
If the refrigerant cylinder does not have a liquid tube, it is highly recommended to use a suitable dryer filter installed between the cylinder and the refrigerant inlet connection in the refrigerating circuit.
This precaution will avoid eventual impurities contained in the cylinder or in the flexible hoses being passed into the circuit.
It is suggested to energize the crankcase heater before starting charging in order to avoid refrigerant condensation in the lubricant.
The charge from high pressure side avoids that refrigerant in liquid state reachs the compressor crankcase, diluting the lubricant contained inside.
The introduced liquid refrigerant causes the compressor discharge valve to close (which act as check valves), expands through the thermal valve and reachs compressor suction valve as vapour.
Charge operations will be faster with higher refrigerant temperatures (and therefore pressure) inside the cylinder; for safety problems, the cylinder temperature must never to be higher than +40°C.
To maintain constant temperature during charge, it is suggested to immerge the cylinder in one vessel with warm water or use a suitable band thermostat crankcase heater.
The cylinder must never be heated with welding torch or other instruments with flames.

5.4 Refrigerant leak detection

Among the indispensable instruments for refrigerating system installation and service, has to be included a leak detector.
Considering both the new enviroment protection requirements and the characteristics of new used refrigerating fluids, for refrigerant leaks research it is suggested the use of one electronic leakage tester.
Available are portable leak detectors with excellent sensibility characteristics,

5.4 Ricerca delle fughe di refrigerante

Tra gli strumenti indispensabili per l'installazione e l'assistenza di impianti frigoriferi, vanno inclusi i cercafughe.
In considerazione sia delle nuove esigenze di protezione dell'ambiente che delle caratteristiche dei nuovi fluidi frigoriferi utilizzati, per la ricerca delle fughe di refrigerante si consiglia l'impiego di un cercafughe di tipo elettronico.
Attualmente sono disponibili cercafughe portatili con eccellenti caratteristiche di sensibilità, idonei sia per refrigeranti CFC/HCFC che per refrigeranti HFC.
La ricerca delle fughe deve essere condotta seguendo le istruzioni suggerite dal costruttore dello strumento e verificando con la sonda tutti i punti di giunzione del circuito frigorifero (saldature, attacchi filettati, attacchi di servizio, flange, etc.).
Qualora si fossero individuate fughe di refrigerante, prima di procedere alla loro riparazione, è necessario rimuovere l'intera carica di refrigerante per mezzo di un adeguato recuperatore (vedi pagina 23, "9.4 Recupero del refrigerante").

suitable both for CFC/HCFC refrigerants and for HFC refrigerants.
The leak detection has to be executed following instructions suggested by the instrument manufacturer and veryfing every refrigerating circuit connections (welded, threaded connections, service connections, flanges, etc.).
In case refrigerant leaks have been found, before repairing them, it is necessary to remove the complete refrigerant charge through a suitable

6. Avviamento del compressore, controlli e rilievi finali

L'inserimento dell'interruttore generale predispone l'alimentazione diretta della eventuale resistenza di riscaldamento del carter e della bobina del teleruttore di comando del compressore.
Si consiglia di predisporre il collegamento elettrico in modo tale da permettere l'alimentazione della resistenza del carter almeno 2 ore prima dell'avviamento che segue un lungo periodo di inattività del compressore così che la temperatura del lubrificante sia superiore a quella ambiente di circa 10K.
Con l'avviamento del compressore, l'operatore ha l'occasione di effettuare misurazioni elettriche molto importanti per una diagnosi del buon funzionamento del compressore quali:

- corrente a rotore bloccato (LRA)
- tensione di alimentazione
- corrente a pieno carico

La corrispondenza tra valori misurati e valori dichiarati, indice di una buona installazione, acquista una rilevante importanza se si considera che le anomalie nella alimentazione elettrica del compressore, rappresentano una delle più frequenti cause della bruciatura del suo motore elettrico.

ATTENZIONE

Tutte le misurazioni elettriche devono essere eseguite all'esterno della scatola terminali.

Nella fase di avviamento, per limitare il pericolo del ritorno di refrigerante liquido al compressore, si consiglia di aprire solo parzialmente il rubinetto di aspirazione e completarne poi l'apertura dopo circa 10 minuti di funzionamento.

6.1 Misurazione della corrente a rotore bloccato

Nei sistemi trifase, è un rilevamento molto utile per verificare il dimensionamento del contattore, dei fusibili e dei cavi della linea di collegamento (vedi pagina 11, "3.4 Selezione del teleruttore, dei fusibili e dei cavi").
Il valore di LRA, misurato con un amperometro digitale, deve corrispondere a quello indicato nella tabella dei dati elettrici del compressore e riportato anche dalla targhetta metallica che equipaggia il compressore stesso (vedi pagina 5, "1.2 La targhetta").

6. Compressor start-up, checks and final reliefs

The general switch insertion arranges the direct feeding of the eventual crankcase heater and of the remote control switch.
It is suggested to arrange the electrical connection in order to allow the crankcase heater feeding at least 2 hours before the start-up which follows a long period of compressor inactivity, so that the lubricant temperature is higher than the environment one by approximately 10K.
During compressor start-up, the operator has the opportunity to take important electrical measurements for a diagnosis of compressor satisfactory operation, like:

- current with locked rotor (LRA)
- feeding tension
- current with full charge

Comparison between measured values and declared values, good installation index, becomes very important if we consider that the compressor electrical feeding anomalies represent one of the most frequent electrical motor burn-out causes.

WARNING

All electrical measurements have to be executed outside the terminal box.

In starting phase, to limit the danger of liquid refrigerant returning to the compressor, it is suggested to open only partially the suction valve and complete then the opening after approximately 10 working minutes.

6.1 Locked rotor current measurement

In three phases systems, it is a very useful measurement to verify the contactor, fuse and connection line cable dimensioning (see page 11, "3.4 Contactor, fuse and cable selection").
The LRA value, measured with a digital amperometer, has to correspond to the one indicated in the compressor electrical data table and also to the metallic nameplate on the compressor (see page 5, "1.2 Name plate").

6.2 Feed voltage measurement

The feed voltage has to be within the tolerance limits (+/-10% of nominal voltage) not only during the compressor working, but also during its start, when from feeding line it verifies the maximum current drawing.

FTE001-03

6.2 Misurazione della tensione di alimentazione

La tensione di alimentazione deve restare entro i limiti di tolleranza (±10% della tensione nominale) non solo durante il funzionamento del compressore ma anche durante il suo avviamento, quando dalla linea di alimentazione si verifica il massimo prelievo di corrente.
Linee di alimentazione di insufficiente portata, sono spesso causa di abbassamenti di tensione; il massimo abbassamento ammissibile è pari al 4% (minima tensione misurata all'avviamento del compressore = tensione di alimentazione -4%).

6.3 Misurazione della corrente a pieno carico

Per eseguire tale misurazione, è necessario avviare il compressore e attendere che le temperature di aspirazione e di scarico si stabilizzino sui valori di progetto.

ATTENZIONE

In presenza di rumori o vibrazioni anomale all'avviamento, fermare subito il compressore, individuarne le cause e applicare i giusti rimedi.

La misurazione della corrente a pieno carico deve essere effettuata contemporaneamente alla lettura delle temperature di lavoro del compressore; il valore di corrente misurato deve essere inferiore o uguale a quello dichiarato dal costruttore alle stesse condizioni di temperatura.
Valori superiori possono essere causati da uno squilibrio della tensione tra le fasi, da una inadeguata carica di refrigerante oppure dalla presenza di gas incondensabili nel refrigerante.

6.4 Controlli finali

Dopo un sufficiente periodo di funzionamento regolare del compressore alle condizioni di progetto dell'impianto, è necessario osservare la spia dell'olio per controllare il livello del lubrificante all'interno del carter.
Fermo restando che il livello minimo accettabile è pari a 1/4 della spia olio, il massimo livello non deve essere maggiore di 3/4 della spia così come illustrato nella figura 13.
Se fosse necessario modificare la quantità di lubrificante contenuta nel carter, è indispensabile seguire scrupolosamente le procedure illustrate a pagina 21, "9.1 Sostituzione del lubrificante".

Voltage drop by compressor starting (often caused by low load lines) cannot exceed 4% (minimum starting voltage = regular voltage - 4%).

6.3 Full load current measurement

To effect this measurement, it is necessary to start the compressor and wait for suction and discharge temperatures settle on designed values.

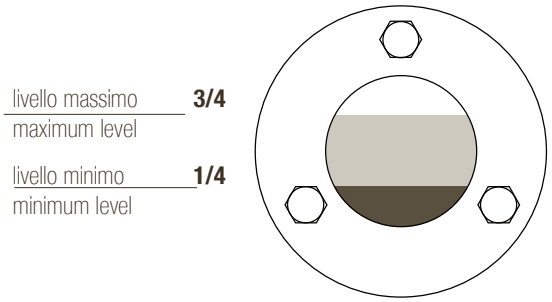
WARNING

By anomalous noises or vibrations on starting, immediately stop the compressor, find the causes and apply the right cures.

The current measurement with full charge has to be executed at the same time as the compressor working temperature reading; the measured current value has to be lower or equal to the one declared by the manufacturer at the same temperature conditions.
Higher values may be caused by a tension unbalance among the phases, by an inadequate refrigerant charge or by uncondensable gas in the refrigerant.

6.4 Final checks

After a suitable period of compressor regular working, it is necessary to check the lubricant oil.
Considering that the acceptable minimum level is 1/4 of oil sight glass, the maximum level cannot be higher than 3/4 of the sight glass, as illustrated in figure 13.
If it is necessary to modify the lubricant quantity contained in the crankcase, follow the procedures illustrated on page 21, "9.1 Lubricant



livello dell'olio - oil level
fig. 13

FTE001-03

7. Equipaggiamenti e accessori

In determinate condizioni di lavoro e di installazione, è necessario garantire il funzionamento ottimale del compressore, equipaggiandolo con accessori idonei che devono essere montati direttamente sul compressore a cura del costruttore oppure, grazie alle istruzioni contenute nei singoli manuali di installazione editi dalla FRASCOLD, montati in un secondo tempo sul compressore già in opera.
Questa parte del manuale di installazione e avviamento, indica brevemente quali sono le condizioni per le quali è necessario installare tali accessori e/o equipaggiamenti.

7.1 Dispositivi per il raffreddamento supplementare del compressore

Tutti i compressori FRASCOLD sono raffreddati dal refrigerante aspirato in condizioni di gas surriscaldato.
Nel percorso che compie attraverso il compressore, il refrigerante lambisce il motore elettrico e lo raffredda, così facendo assorbe calore che produce un aumento sia del suo contenuto entalpico che della sua temperatura.
Successivamente, l'energia impiegata per comprimere il refrigerante si trasferisce in gran parte al gas stesso sotto forma di calore (calore di compressione) causando un ulteriore aumento di temperatura.
In condizioni normali, la temperatura del gas alla fine della compressione non supera mai +130°C.
La temperatura durante il funzionamento gioca un ruolo determinante nella durata del compressore, perchè è in presenza di alte temperature che si creano, nel compressore stesso, situazioni di rischio per la sua incolumità e tali alte temperature possono verificarsi in condizioni operative particolarmente spinte.
Nelle tabelle delle capacità frigorifere, riportate nei cataloghi dei compressori FRASCOLD, è segnalato in modo inequivocabile quando le condizioni operative sono tali da richiedere il raffreddamento supplementare del compressore e anche quale è il dispositivo da adottare in relazione alle specifiche condizioni di lavoro.
Per il raffreddamento supplementare dei compressori FRASCOLD, i dispositivi disponibili sono:

- dispositivo di iniezione di liquido
- motoventilatore per il raffreddamento delle testate
- testate raffreddate ad acqua

Una volta verificata la necessità di tali dispositivi, gli stessi possono essere montati sul compressore direttamente in fabbrica (ordinando il dispositivo congiuntamente al compressore), oppure anche dopo la installazione del compressore.

7.2 Riscaldatore dell'olio del carter

Durante il periodo di arresto dell'impianto frigorifero, il refrigerante tende a migrare verso il compressore.
La presenza di refrigerante liquido nella linea di aspirazione ne rende inevitabile il suo fluire nel carter del compressore miscelandosi con il lubrificante contenuto; una miscela tra lubrificante e una grande quantità di refrigerante è la premessa a una serie di problemi spesso causa di danni irreversibili.
L'impiego del riscaldatore olio carter, è il modo per ridurre (ma non per elimare) il fenomeno del ritorno di refrigerante liquido nonchè del suo accumulo o stratificazione nel compressore.

7.3 Controllo di capacità

Nel corso della progettazione di un impianto di raffreddamento, il compressore selezionato ha una capacità sufficiente a smaltire il picco del carico termico della struttura e alternare periodi di arresto e funzionamento con una frequenza compatibile con il massimo numero di cicli per ora del compressore stesso (vedi pagina 7, "1.10 I cicli di funzionamento").
In condizioni di carico termico ridotto, il compressore è in grado di portare la

7. Equipment and accessories

In some working and installation conditions, it is necessary to grant the optimal compressor working, equipping it with suitable accessories.
These accessories can be directly assembled on the compressor by the manufacturer or, thanks to instructions contained in the single FRASCOLD installation manuals, assembled onto the compressor already operating at site.
This installation and start-up manual shows the conditions for which it is necessary to install these accessories and/or equipments.

7.1 Devices for compressor additional cooling

All FRASCOLD compressors are suction gas cooled.
As the superheated suction vapour passes through the compressor and over the electrical motor, it cools the windings; in this way it absorbes heat which produces an increase both of enthalpic content and of its temperature.
Successively, the energy used to compress the refrigerant transfers heat to the gas (discharge heat), causing a further temperature increase.
In normal conditions, gas temperature at compression end must never exceed +130°C.
The temperature during working has a determinant role in compressor life, because it is with high temperatures that, in the compressor, risk situations for its safety create and these high temperatures can verify in particularly forced operative conditions.
In the refrigerating capacity tables, on FRASCOLD compressor catalogues, is indicated, in unequivocal way, when the operative conditions are such to request the compressor additional cooling and also what is the device to use with respect of specific working conditions.
For additional cooling, the devices available are:

- liquid injection
- head fan motor
- water-cooled heads

After veryfing these devices necessity, these may be assembled on the compressor directly in factory (by ordering the device together with the compressor).

7.2 Oil crankcase heater

During refrigerating system stop period, the refrigerant migrates towards the compressor.
The liquid refrigerant in the suction line will inevitably flow to the compressor crankcase mixing with the contained lubricant.
A mixture between lubricant and a big refrigerant quantity is the cause of a series of problems that is often cause of irreversible damages for the compressor.
The oil crankcase heater use is the way to reduce (but not to eliminate) the case of liquid refrigerant return to the compressor, refrigerant accumulation or stratification .

7.3 Capacity control

By designing a cooling plant, the selected compressor has a capacity sufficient to carry off the structure thermal charge peak and alternate stopping and working periods with a frequency compatible with the maximum compressor cycle number per hour (see page 7, "1.10 Maximum stop/start per hour").
In reduced thermal charge conditions, the compressor is able to bring the structure at the designed temperature in a shorter time.
It is necessary to verify if the increased number of compressor starts (which results from a shorter cooling period) is compatible with the maximum that the compressor can stand.
The capacity control device installation allows to compensate this situation to avoid to compromise the complete cooling plant efficiency.

7.4 Unloaded start

The unlaoded start device has been designed to reduce the start current of

FTEC01-03

struttura alla temperatura di progetto in un tempo più breve; in tale caso, è necessario verificare se l'aumentato numero di avviamenti del compressore (che deriva da un più breve periodo di raffreddamento) è compatibile con il massimo che il compressore può sopportare.
L'installazione del dispositivo per il controllo della capacità permette di compensare tale situazione per evitare di compromettere l'efficienza dell'intero impianto di raffreddamento.

7.4 Avviamento in vuoto

Il dispositivo per l'avviamento in vuoto è stato progettato per ridurre la corrente di spunto di compressori con potenza nominale superiore a 5 HP.
L'impiego di tale dispositivo è particolarmente consigliato per compressori con avviamento di tipo PWS (Part Winding Start) oppure di tipo ⅄ / Δ (stella/triangolo); il suo funzionamento all'avviamento del compressore, riduce la coppia di spunto ed il momento di inerzia delle masse.

N.B. Per limitare la quantità di lubrificante e refrigerante nel compressore dotato di dispositivo per l'avviamento in vuoto, fare funzionare il compressore con la massima riduzione di capacità per almeno 5 secondi prima del suo arresto.

compressor with nominal power higher than 5 HP; the use of this device is particularly suggested for compressors with PWS (Part Winding Start) or ⅄ / Δ (star/delta) start; its target is to reduce the start torque to the inertia of the moving masses.

N.B. To limit the amount of oil and refrigerant into the compressor equipped with unloaded start device, run it for 5 seconds approx. with largest capacity reduction, the stop the compressor.

8. Accessori vari

Spesso è necessario equipaggiare l'impianto frigorifero con accessori e/o dispositivi non di stretta competenza del costruttore del compressore ma indispensabili per il suo buon funzionamento.
Considerata la inevitabile interazione tra compressore e tali accessori, è necessario che questi ultimi rispondano a precisi requisiti tecnici.
Il montaggio deve essere comunque eseguito attenendosi scrupolosamente alle istruzioni rilasciate dal costruttore dell'accessorio che deve essere comunque conforme ai requisiti qui di seguito descritti.

8.2 Tubi antivibranti

Anche se il compressore è equilibrato staticamente e dinamicamente, si consiglia di montare tubi antivibranti sia sulla linea di aspirazione che sulla linea di mandata.
I tubi antivibranti non sopportano carichi in trazione e compressione, pertanto vanno installati parallelamente all'asse di rotazione del compressore e il più vicino possibile ad esso (vedi figura 14).

8.3 Separatore d'olio

L'installazione di un separatore d'olio è raccomandato in quegli impianti dove sussistono le condizioni per importanti travasi di olio dal compressore o eccessive diluizioni dell'olio da parte del refrigerante come:

- impianti dove l'unità condensatrice, installata all'esterno, sia soggetta a basse temperature ambientali
- impianti che lavorano con elevati rapporti di compressione (basse temperature di evaporazione, alte temperature di scarico)
- impianti che utilizzano compressori con dispositivo di controllo della capacità
- impianti con più compressori in parallelo

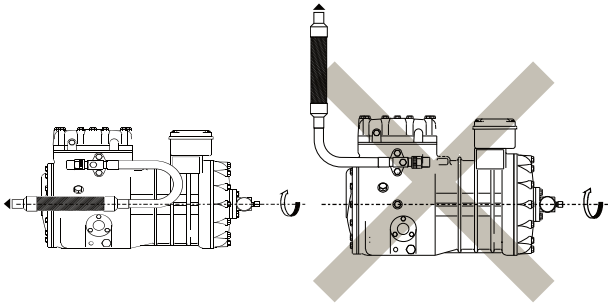


fig. 14

8. Various accessories

Often it is necessary to equip the refrigerating system with accessories and/or devices that are not of compressor manufacturer tight competence, but indispensable for its good working.
Considering the inevitable interaction between compressor and these accessories, it is necessary that these last ones correspond to precise technical requirements.
The assembly has to be, however, executed following strictly the instructions given by the accessory manufacturer, that has to be in accordance with the following requirements.

8.2 Vibration absorber tubings

Even if the compressor is statically and dynamically balanced, it is suggested to assemble vibration absorber pipes both on suction line and on discharge line.
The vibration absorber pipes will not bear stretching and compression, they have therefore to be installed parallelly to the axis of rotation of the compressor and as near as possible to it (see figure 14).

8.3 Oil separator

The oil separator installation is recommended in those plants, in which there are the conditions for potential oil transfers from compressor or excessive oil dilutions from refrigerant, like:

- plants, in which the condensing unit, installed outside, is subject to low ambient temperatures
- plants that work with high pressure ratio (low evaporating temperatures, high discharge temperatures)
- plants that use compressors with capacity control device
- plants with a number of compressors in parallel
- plants with refrigerant charge (in kg) that is six times higher than the

FTE001-03

- impianti con carica di refrigerante (espressa in kg) maggiore di sei volte rispetto la normale carica di olio del compressore (espressa in litri).

Il separatore di olio deve essere installato sulla linea di scarico, dopo l'eventuale silenziatore e il tubo antivibrante e il più vicino possibile al compressore.
Prima del suo montaggio, è necessario introdurre all'interno del separatore una quantità (suggerita dal costruttore) di olio dello stesso tipo di quello contenuto nel compressore; tale quantità rimane sempre all'interno del separatore e serve per "attivare" la valvola di ritorno olio del separatore.
L'attacco di ritorno olio del separatore deve essere collegato all'attacco posto sul carter del compressore (vedi disegni del catalogo), dopo che ne è stato rimosso il tappo e sostituito con un niplo.
Una valvola di ritegno montata sulla linea di scarico in uscita dal separatore, eviterà il riflusso di refrigerante durante le fasi di arresto del compressore.

8.4 Separatore di liquido

Il separatore di liquido (o accumulatore di aspirazione) è l'unico dispositivo che può evitare danni irreversibili al compressore quando, durante il funzionamento, si verifica afflusso di refrigerante liquido nella linea di aspirazione.
In aspirazione, il refrigerante può essere in forma liquida per cattiva esecuzione delle tubazioni, insufficiente potenza dell'evaporatore, ma anche per le cause più comuni quali la brinatura dell'evaporatore, il mancato funzionamento del suo ventilatore oppure la linea di aspirazione non isolata con temperatura ambiente molto bassa.
Il separatore di liquido deve essere montato nel tratto terminale della linea di aspirazione e il più possibile in prossimità del compressore.

8.5 Termostato di regolazione

È un apparecchio di controllo la cui regolazione del differenziale (differenza tra la temperatura alla quale il suo interruttore apre e quella alla quale chiude il circuito di alimentazione del compressore) è importante nei confronti della vita operativa del compressore.
Il differenziale del termostato deve essere commisurato al comportamento della temperatura rilevata dal suo elemento sensibile e tale da evitare che il compressore funzioni con un numero di cicli superiore al suo limite massimo (vedi pagina 7, "1.10 I cicli di funzionamento").
Il collegamento elettrico del termostato di regolazione deve essere eseguito come indicato negli schemi elettrici .

8.6 Pressostato di alta pressione

Per salvaguardare il buon funzionamento del compressore e garantirne la sua integrità, è consigliabile dotare il circuito frigorifero di un pressostato di alta pressione, la cui corretta selezione, installazione e taratura evita il funzionamento del compressore in condizioni non accettabili (vedi pagina 7,"1.11 Limiti di impiego").
Il pressostato dovrà intervenire, interrompendo il circuito di alimentazione del compressore, quando la pressione di compressione assume valori prossimi ai limiti di impiego.
Conoscendo perfettamente le condizioni operative dell'impianto, è possibile fare intervenire il pressostato quando, a causa di anomalie durante il funzionamento, la pressione di compressione del compressore supera di poco la pressione di condensazione ma rimane comunque inferiore alla pressione di taratura della valvola di sicurezza.
La pressione alla quale avviene la chiusura del circuito di alimentazione del compressore (pressione di apertura dei contatti-differenziale) deve essere inferiore alla pressione di funzionamento del circuito frigorifero.
Si consiglia l'impiego di un pressostato dotato di reinserzione manuale che è un dispositivo meccanico che mantiene aperto il circuito di alimentazione del compressore anche quando la pressione è scesa al di sotto del valore di chiusura; tale impedimento all'avvio del compressore rimane fino a quando l'operatore, dopo avere rimosso le cause di intervento, non preme

normal compressor oil charge (in litres)

The oil separator has to be installed on the discharge line, after the eventual muffler and the vibration absorber pipe.
Before its assembly, it is necessary to introduce inside the separator an oil quantity (suggested by manufacturer) of the same type of the one contained in the compressor; this quantity remains always inside the separator and is useful to "activate" the separator oil return valve.
The separator oil return connection has to be connected to the connection on the compressor crankcase (see drawings on catalogue), after the plug has been removed and replaced with a nipple.
It is recommended to install a check-valve on outlet pipe of the oil separator.

8.4 Liquid separator

The liquid separator (or suction accumulator) is the sole device that can avoid irreversible damage to the compressor when, during working, there is liquid refrigerant that flows back to the suction line.
In the suction line, the refrigerant may be in liquid form due to bad pipe execution, insufficient evaporator power, but also for the most common causes like the evaporator frosting, the inoperative fan or insifficient insulation of the suction line with very low environment temperature.
The liquid separator has to be assembled in the suction line terminal section and as near as possible to the compressor.

8.5 Regulating thermostat

It is a check instrument and its differential regulation (difference between the temperature at which its switch opens and the one at which it closes the compressor feeding circuit) is important towards the compressor operative life.
The thermostat differential has to be compared to the temperature behavior pointed out from its sensible element and in order to avoid that the compressor works with a cycle number that is higher than its maximum limit (see page 7, "1.10 Maximum stop/start per hour").
The regulating thermostat electrical connection has to executed as indicated in the wiring diagrams.

8.6 High pressure switch

To safe the compressor good working and grant its integrity, it is advisable to equip the refrigerating circuit with an high pressure switch; its right selection, installation and calibration avoids the compressor working in unacceptable conditions (see page 7, "1.11 Application limits").
The pressure switch should intervene, by interrupting the compressor feed, when the discharge pressure reachs values near application limits.
By knowing perfectly the plant operative conditions, it is possible for the pressure switch to intervene when, due to anomalies during working, the compressor discharge pressure exceeds by only a little the condensing pressure, but it remains however lower than the safety valve calibrating pressure.
The most common causes of these anomalies are condenser fouling, lack or shortage of condenser cooling fluid, incondensable gas in the refrigerant, excessive refrigerant charge.
The pressure at which there is the compressor feeding circuit closing (opening pressure of contacts - differential) has to be lower than refrigerating circuit designed working pressure.
It is recommended that a pressure switch with manual reset is used; this is a mechanical device that ensures the contacts remain open and the compressor does not restart after the pressure falls below the closing value.
This requires the operator to investigate the anomaly and rectify before resetting the switch.
The pressure switches with manual reset are characterized by a fixed differential and considering this thay have to be selected with particular care.

l'apposito pulsante del pressostato.
I pressostati con reinserzione manuale sono caratterizzati da un differenziale fisso e in considerazione di ciò vanno selezionati con particolare cura.
Il pressostato deve essere collegato a una presa di alta pressione del compressore (vedi pagina 9, "3.2 Collegamenti frigoriferi") o, eventualmente, anche a un punto qualsiasi della linea di compressione e comunque a monte di un eventuale rubinetto di intercettazione della linea stessa.
Evitare assolutamente di collegare il pressostato di alta pressione a connessioni che possono essere involontariamente intercettate come, per esempio le connessioni di servizio dei rubinetti del compressore.
Il collegamento elettrico del pressostato deve essere eseguito come indicato negli schemi elettrici.

8.7 Pressostato di bassa pressione

Il corretto funzionamento del pressostato di bassa pressione evita che il compressore lavori per periodi più o meno lunghi in condizioni di insufficiente pressione di aspirazione.
Le più comuni cause di anomale pressioni di aspirazione sono insufficiente carica di refrigerante, ostruzioni oppure eccessive perdite di carico della linea del liquido, formazione di brina sull'evaporatore.
Qualsiasi sia la causa, l'abbassamento della temperatura di aspirazione conseguente all'abbassamento della pressione si rivela, quasi sempre, inadeguato a compensare la riduzione di portata ponderale di refrigerante, pregiudicando il buon raffreddamento del compressore.
Negli impianti frigoriferi funzionanti con temperatura di evaporazione positiva, il pressostato di bassa pressione può essere utilizzato anche come sicurezza anti-gelo tarandolo in modo da arrestare il compressore quando la pressione di evaporazione scende a valori corrispondenti a temperature di saturazione negative.
Deve essere collegato a una presa di bassa pressione del compressore o, eventualmente, anche a un punto qualsiasi della linea di aspirazione e comunque a valle di un eventuale rubinetto di intercettazione della linea stessa.
Evitare assolutamente di collegare il pressostato di alta pressione a connessioni che possono essere involontariamente intercettate come, per esempio le connessioni di servizio dei rubinetti del compressore.
Il collegamento elettrico del pressostato deve essere eseguito come indicato negli schemi elettrici.

8.8 Manometri

I manometri sono strumenti essenziali per la messa a punto e per il controllo del funzionamento di un circuito frigorifero.
Una volta montati sul pannello di comando e collegati, permettono la lettura a distanza delle pressioni di lavoro del circuito frigorifero.
Il collegamento permanente di manometri prevede l'impiego di tubi (in rame o materiale plastico) e di rubinetti di intercettazione a due vie, che consentono di attivare i manometri soltanto quando sia necessario effettuare i rilevamenti.
Il quadro manometri prevede per ogni compressore, un manometro di bassa pressione, un manometro di alta pressione e, per i soli compressori dotati di pompa di lubrificazione, un manometro per olio.
I manometri di alta e bassa pressione forniscono oltre ai valori delle pressioni anche le corrispondenti temperature di saturazione.
Un preciso limite dei manometri per refrigerante, è costituito dalla loro inadeguatezza a misurare i livelli di vuoto; tali livelli possono essere misurati efficacemente soltanto da adatti vacuometri elettronici.
Il manometro per olio permette di leggere la pressione di mandata della pompa di lubrificazione del compressore così da verificarne il corretto funzionamento e permettere la taratura del pressostato differenziale olio, come indicato a pagina 18, "8.1 Pressostato differenziale olio".
I manometri devono essere collegati tenendo conto delle indicazioni riportate a pagina 9, "3.2 Collegamenti frigoriferi".

The pressure switch has to be connected to a compressor high pressure tap (see page 9, "3.2 Refrigerating connections") or, eventually, also to any discharge line point and, however, upstream an eventual interception valve of the line.
Avoid absolutely to connect the high pressure switch at connections that can be involuntarily intercepted like,for example, the compressor valve service connections; the connection has to be executed as indicated in the wiring diagrams.

8.7 Low pressure switch

The low pressure switch avoids the compressor working for more or less long periods in conditions of insufficient suction pressure.
The most common cause of anomalous suction pressures are insufficient refrigerant charge, obstructions or excessive charge leaks of liquid line, frost formation on the evaporator.
Apart every cause, the suction temperature fall resulting from the pressure fall is, almost always, inadequate to compensate the refrigerant ponderal capacity reduction, compromising the good compressor cooling.
In refrigerating plants that work with positive evaporating temperature, the low pressure switch may be used also like anti-freeze safety, calibrating it in order to stop the compressor when evaporating pressure falls at values which correspond to saturation negative temperatures.
The pressure switch has to be connected to a compressor low pressure tap or, eventually, also to any suction line point and, however, upstream an eventual interception valve of the line.
Avoid absolutely to connect the high pressure switch at connections that can be involuntarily intercepted like, for example, the compressor valve service connections.
The pressure switch electrical connection has to be executed as indicated in the wiring diagrams.

8.8 Pressure gauges

Gauges are indispensable instruments for the refrigerating circuit setting up and working check; after their assembly on the control panel and their connections, they allow the remote reading of the refrigerating circuit working pressures.
The permanent gauge connection foresees the use of two-way pipes (in copper or plastic material) and interception valves, which allow to activate the gauges only when it is necessary to effect measurements.
The gauge panel foresees, for each compressor, a low pressure gauge, an high pressure gauge and, only for compressors equipped with lubricating pump, an oil pressure gauge.
The high and low pressure gauges furnish, besides the pressure values, also the corresponding saturation temperatures.
A precise gauges limit for refrigerant is characterized by their inadequacy to measure the vacuum levels; these levels can be efficiently measured only from suitable electronic gauges.
The oil gauge allows to read the compressor lubricating pump discharge pressure in order to verify the right working and permit the oil pressure switch calibration, as indicated on page 18, "8.1 Oil pressure switch".
Pressure gauges have to be connected following the indications on page 9, "3.2 Refrigerating connections".

8.9 Filter dryer

The use of the new HFC refrigerants and of foreign lubricants, requires a particular attention as concerns their compatibility with the material contained in the dryer filters.
The filter has to guarantee a screen of at least 3Å and a residual humidity not higher than 50PPM, this both if it contains dryer material like solid cartridge and like compact grains.
The filter with solid cartridge may be assembled in any position; in the second case, to avoid that the dryer material abrades because of liquid column pulsations, it is necessary that the filter is assembled with vertical axis and

8.9 Filtro deidratore

L'impiego dei nuovi refrigeranti HFC e dei lubrificanti esteri, richiede una particolare attenzione per quanto riguarda la loro compatibilità con il materiale contenuto nei filtri deidratori.
Il filtro deve garantire un vaglio di almeno 3Å e una umidità residua non superiore a 50PPM, questo sia che contenga materiale deidratante in forma di cartuccia solida che in grani compatti.
Nel secondo caso, per evitare che il materiale deidratante si abrada per effetto delle pulsazioni della colonna liquida, occorre che il filtro sia montato con asse verticale e che la linea del liquido entri dall'alto e esca dal basso.
In tale modo, durante il funzionamento del compressore, il materiale deidratante viene spinto verso il basso dal refrigerante e il suo assetto non viene modificato all'arresto del compressore.

8.10 Le linee di compressione, del liquido e di aspirazione

Ciascuna linea deve essere dimensionata e realizzata in modo da favorire la circolazione del refrigerante e il ritorno dell'olio con il compressore in funzione ma ostacolare il ritorno di refrigerante liquido con il compressore fermo.
I principali criteri generali che stanno alla base di una buona progettazione delle linee frigorifere sono:

- per tutte le linee

that the liquid line enters from upper and goes out from bottom.
In this way, during the compressor working, the dryer material is pushed towards the bottom by refrigerant and its attitude is not modified by compressor stopping.

8.10 Discharge, liquid and suction lines

Each line has to be dimensioned and realized in order to favour the refrigerant circulation and the oil return with the compressor operative, but restrict the liquid refrigerant return with the standstill compressor.
The main general principles which are the basis of a good refrigerating lines design are:

- for every lines
  - slope of at least 1% in the flow direction
  - refrigerant velocity to allow the refrigerant entrainment without excessive pressure drop
- for suction and discharge lines

FTEC01-03

9. Controlli periodici e manutenzione

Il periodico controllo delle pressioni di lavoro e del livello del lubrificante sono garanzia sufficiente per una lunga vita operativa del compressore e la costanza delle sue prestazioni dichiarate.
Gli interventi di manutenzione routinaria richiesti sono:

- sostituzione del lubrificante dopo circa 100 ore di funzionamento dall'avviamento iniziale del compressore per rimuovere le impurità rimaste nel sistema e raccolte nel carter dal flusso di refrigerante e di lubrificante
- sostituzione della carica di lubrificante ogni 10.000 ore di funzionamento per garantirne le originali caratteristiche di viscosità

9.1 Sostituzione del lubrificante

Tutte le operazioni di sostituzione del lubrificante devono essere eseguite solamente quando il compressore è fermo.
Tutti i lubrificanti, in particolare modo quelli di tipo sintetico, sono altamente igroscopici; per evitare la contaminazione del lubrificante, è necessario conservare i contenitori ben sigillati, aprirli appena prima del loro utilizzo quindi richiuderli immediatamente dopo.
Il lubrificante utilizzato, deve essere esclusivamente di tipo approvato dal costruttore così come illustrato nel documento FTEC27.
Per la sostituzione del lubrificante sono necessari alcuni strumenti che fanno parte della normale attrezzatura di ogni frigorista.
Gli attrezzi necessari per eseguire le operazioni di manutenzione ordinaria sono:

- pompa per vuoto
- pompa a mano per lubrificante
- tubi flessibili con attacchi girevoli e percussore

9. Periodical checks and servicing

The periodical working pressure and lubricant level check are sufficient warranty for a long compressor operative life and for the reliability of the declared performances.
The requested maintenance interventions are:

- lubricant replacement after approx. 100 working hours from the initial compressor start to remove impurities remained in the system and collected in the crankcase from refrigerant and lubricant flow
- lubricant charge replacement each 10000 working hours to grant the original viscosity characteristics

9.1 Lubricant replacement

All lubricant replacement operations have to be executed when the compressor is at standstill.
All lubricants, especially the ones of synthetic type, are highly hygroscopic; to avoid the lubricant contamination, it is necessary to keep the packages well sealed, open them just before their use and therefore reclose them after immediately.
The used lubricant has to be exclusively approved by the manufacturer, as illustrated document FTEC27.
For lubricant replacement are required instruments that are part of the normal equipment of each refrigerator technician; the necessary instruments to execute the ordinary maintenance operations are:

- vacuum pump
- lubricant hand pump
- flexible hoses with swivel connections and valve opener
- ratchet wrench for square stems

a) with working compressor, close the suction valve

- chiave a cricco per aste quadre

Per la sostituzione del lubrificante del compressore, procedere come segue:

a) con il compressore in funzione, chiudere il rubinetto di aspirazione
b) non appena la pressione di aspirazione si riduce a 0.1 ÷ 0.2 bar, spegnere il compressore

ATTENZIONE

Non allentare alcuna vite o tappo di chiusura del compressore.

c) chiudere il rubinetto di compressione
d) rimuovere i dadi ciechi dagli i rubinetti del compressore
e) rimuovere, lentamente, il tappo di scarico olio (vedere disegni a catalogo) e lasciare fluire tutto il lubrificante in un idoneo contenitore

ATTENZIONE

Non disperdere il lubrificante nell'ambiente; è un rifiuto speciale e come tale deve essere smaltito secondo le norme in vigore.

f) avvitare e serrare bene il tappo di scarico olio
g) avvitare i dadi ciechi dei rubinetti del compressore precedentemente rimossi
h) rimuovere il tappo di carico olio (riferimento 3, vedi disegni sul catalogo) applicando al suo posto una valvola di servizio tipo Schrader
i) rimuovere il cappuccio di protezione dalla valvola di servizio e collegare la mandata della pompa a mano per lubrificante
j) collegare l'aspirazione della pompa a mano al contenitore del lubrificante
k) azionando la pompa a mano, introdurre la esatta quantità di olio nel carter del compressore
l) rimuovere la pompa a mano dalla valvola di servizio
m) collegare l'aspirazione della pompa per vuoto alla valvola di servizio tipo Schrader
n) avviare la pompa per vuoto ed evacuare il compressore per almeno 15 minuti
o) scollegare la pompa dalla valvola di servizio e spegnerla
p) avvitare il cappuccio di protezione alla valvola di servizio
q) aprire i rubinetti di compressione e di aspirazione del compressore

ATTENZIONE

La mancata apertura del rubinetto di compressione prima dell'avviamento può causare notevoli danni sia al compressore che all'operatore.

r) avviare il compressore e dopo un adeguato periodo di funzionamento, controllare il livello del lubrificante.

Fermo restando che il livello minimo accettabile è pari a 1/4 della spia olio, il massimo livello non deve essere maggiore di 3/4 della spia così come illustrato nella figura 15.

9.2 Controllo dei termistori

I compressori serie F, S, V, Z e W vengono forniti completi di protezione integrale, conforme alla norma DIN44081 ed è costituita da termistori PTC inseriti nello statore del motore elettrico e collegati a un modulo elettronico di controllo KRIWAN (modello T00ECA01 per i compressori serie A, B, C, D, F, Q e S; modello T00ECA11 per i compressori serie V, Z e W).

Qualora fosse necessario verificare la continuità della catena dei termistori, procedere come segue:

a) scollegare il compressore dalla rete di alimentazione elettrica
b) rimuovere il coperchio della scatola terminali

b) when the suction pressure reduces at 0.1÷0.2 bar, switch off the compressor

WARNING

Do not loose any compressor bolt or closing plug.

c) close the discharge valve
d) remove, slowly, discharge valve plug
e) remove the oil discharge plug (ref.6, see drawings on catalogue) and let flow all the lubricant in a suitable package.

WARNING

Do not pollute the environment with lubricant; it is a special waste and it hase therefore to be carried off as per the regulations in force.

f) screw and close well the oil discharge plug and discharge valve plug
g) remove the oil charge plug (ref.3, see drawings on catalogue), applying at its place a Schrader service valve
h) remove the protection cap from the service valve and connect the lubricant hand pump discharge
i) connect the hand pump suction to the lubricant package
j) by acting the hand pump, introduce the right oil quantity in the compressor crankcase
k) remove the hand pump from the service valve
l) connect the vacuum pump suction line to the Schrader service valve
m) start the vacuum pump and evacuate the compressor for at least 15 minutes
n) disconnect the pump from the service valve and switch off
o) screw the protection cap to the service valve
p) open the compressor discharge and suction valves

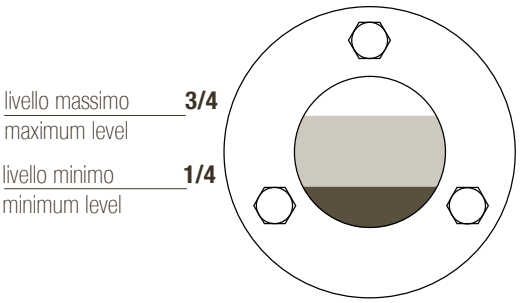
WARNING

Failure to open the valve before starting, will cause many damages both to compressor and possibly to operator.

q) start the compressor
r) after 15 ÷ 20 working minutes, check the lubricant level

The level at which the lubricant settles during compressor working is highly influenced by the discharge ratio and therefore by the working temperatures.

Considering that the acceptable minimum level is 1/4 of oil sight glass, the maximum level has not to be higher than 3/4 of the sight glass, as illustrated in figure 15.



livello dell'olio - oil level

fig. 15

9.2 Thermistor check

All compressors are supplied complete with integral protection, in accordance with DIN44081 regulation and it is composed by PTC thermistors introduced in the electrical motor stator and connected to an electronic control module KRIWAN (model T00ECA01 for compressors A, B, D, F, Q and S series;

FTE001-03

c) rimuovere i capicorda femmina dai terminali a baionetta A e B dei termistori
d) porre a contatto dei terminali A e B i puntali di un ohmetro avente ai capi una tensione massima di 2,5V; se l'ohmetro indica una resistenza infinita significa che la catena dei termistori è interrotta
I valori di resistenza misurati devono essere coerenti con quelli riportati in tabella "11.20 caratteristiche dei termistori".
e) collegare i capicorda ai terminali A e B dei termistori
f) montare e fissare il coperchio della scatola terminali
g) collegare il compressore alla rete di alimentazione elettrica

9.3 Sostituzione del sensore di temperatura

Per la sostituzione del sensore di temperatura inserito sul lato compressione della testata, procedere come segue:
a) con il compressore in funzione, chiudere il rubinetto di aspirazione
b) non appena la pressione di aspirazione si riduce a 0.1 ÷ 0.2 bar, spegnere il compressore
c) chiudere i rubinetti di compressione e di aspirazione del compressore
d) scollegare il compressore dalla rete di alimentazione elettrica
e) rimuovere i conduttori del sensore di temperatura dal circuito di controllo e protezione del compressore

ATTENZIONE

Il sensore di temperatura è in contatto diretto con la zona di compressione del compressore .

f) allentare lentamente il dado cieco del rubinetto di compressione e riavvitarlo dopo avere lasciato sfiatare la pressione residua
g) con una chiave da 17 mm, rimuovere lentamente il sensore in avaria
h) avvitare il nuovo sensore dopo avere spalmato di pasta sigillante la sua filettatura
i) collegare i conduttori del sensore agli appositi morsetti del circuito di controllo e protezione
j) evacuare adeguatamente il compressore
k) aprire i rubinetti di compressione e di aspirazione del compressore
l) con un cercafughe elettronico, verificare la tenuta del sensore di temperatura

9.4 Recupero del refrigerante

Tutte le volte che le operazioni di riparazione o sostituzione di un componente del circuito frigorifero ne compromettono la sua tenuta, si rende necessario prima procedere al recupero del refrigerante.
Il recupero parziale della carica di refrigerante è possibile se il punto di intervento è situato nella parte di circuito compresa tra il rubinetto di intercettazione posto all'uscita del ricevitore di liquido (o del condensatore ad acqua) e il rubinetto di intercettazione sullo scarico del compressore.
In questo caso, si provvede a trasferire buona parte del refrigerante nel ricevitore di liquido (o nel condensatore ad acqua) applicando la seguente procedura.
a) cortocircuitare il pressostato di bassa pressione e avviare il compressore
b) chiudere il rubinetto di intercettazione della linea del liquido
c) non appena tutto il refrigerante è stato aspirato, spegnere il compressore
d) chiudere il rubinetto di intercettazione sullo scarico del compressore
e) **scollegare il compressore dalla rete di alimentazione elettrica**
f) eseguire i necessari interventi di manutenzione
g) evacuare la parte di circuito frigorifero sulla quale si è intervenuto
h) aprire i rubinetti di intercettazione

Qualora non fosse possibile operare come precedentemente descritto, è necessario procedere al recupero della intera carica di refrigerante per mezzo di una idonea unità di recupero.
In questo caso si consiglia di adottare i seguenti accorgimenti.
- collegare l'unità di recupero a due attacchi di servizio del circuito frigorifero, uno posto sul lato di bassa e l'altro sul lato di alta

model T00ECA11 for compressors V, Z and W series).
If it is necessary to verify the thermistor chain continuity, proceed as follows:
a) **disconnect the compressor from the electrical feeding net**
b) remove the terminal box cover
c) remove the female quick connect terminals from the thermistor A and B bayonet terminals
d) connect to A and B terminals the test prods of the ohmmeter, that has at the ends a maximum tension of 2.5V; if the ohmmeter shows an infinite strength, it means that the thermistor chain is interrupted
The reading of values in accordance with those indicated on table "11.20 Thermistor data", shows a suitable and continue thermistor chain.
e) connect the quick connect terminals to the thermistor A and B terminals
f) assemble and fix the terminal box cover
g) connect the compressor to the electrical feeding net

9.3 Temperature sensor replacement

For replacement of the temperature sensor inserted on the compressor head discharge side, proceed as follows:
a) close suction shut off valve with compressor running
b) as oon as the suction pressure decreases down to 0.1 ÷ 0.2 bar, switch off the compressor
c) close thesuction and discharge shut off valves
d) disconnect the compressor from the electrical feeding net
e) remove the temperature sensor conductors from the compressor check and protection circuit

WARNING

The sensor is in direct connection with the refrigerating circuit high pressure side.

f) release the discharge valve plug and screw on it as soon the residual pressure has been vented
g) close the compressor discharge and suction valves
h) with one key of 17mm, remove slowly the failed sensor
i) screw the new sensor after having smeared its thread with a sealing paste
j) connect the sensor conductors to the suitable check and protection circuit clamps
k) evacuate adequately the compressor
l) open the compressor discharge and suction valves
m) with an electronic leak detector, verify the temperature sensor sealing

9.4 Refrigerant recovery

Every time that the repair or replacement operations of a refrigerating circuit component compromise its sealing, it is necessary to proceed at first to the refrigerant recovery.
The partial refrigerant charge recovery is possible if the intervention point is placed in the system between the shut-off valve placed at the liquid receiver (or water condenser) exit and the shut-off valve on the compressor discharge.
In this case, a considerable quantity of refrigerant is transferred in the liquid receiver (or in the water condenser) applying the following procedure:
a) short-circuit the low pressure switch and start the compressor
b) close the liquid line shut-off valve
c) as soon as the whole refrigerant has been removed, switch off the compressor
d) close the discharge shut-off valve of the compressor
e) **disconnect the compressor from the electrical feeding net**
f) execute the necessary maintenance interventions
g) evacuate the refrigerating circuit part on which it has been opened
h) open the shut-off valves

FTEC01-03

pressione; il recupero avverrà in tempi più ridotti

- durante il recupero, all'interno dell'evaporatore e del condensatore la pressione (e quindi la temperatura) scende a valori molto bassi. Per evitare la dannosa formazione di ghiaccio all'interno di evaporatori e condensatori ad acqua, gli stessi devono essere preventivamente vuotati oppure mantenere costantemente in funzione le pompe di circolazione fino alla fine del recupero.
- durante il recupero è possibile che dal circuito frigorifero, insieme al refrigerante, venga estratto anche del lubrificante. Al termine del recupero, è necessario verificare la quantità di lubrificante fuoriuscito e, una volta ultimato l'intervento di riparazione, immettere nel carter del compressore del lubrificante nuovo in quantità e tipo identico a quello rimosso.

ATTENZIONE

Non disperdere il lubrificante nell'ambiente; è un rifiuto speciale e come tale deve essere smaltito secondo le norme in vigore.

9.5 Sostituzione del pressostato differenziale olio

Il pressostato differenziale olio di tipo elettronico che equipaggia i compressori FRASCOLD con pompa di lubrificazione è essenzialmente composto da (vedi fig. 16):

- circuito di controllo; completo di ghiera di fissaggio, pulsante di reinserzione, LED di segnalazione, cavi di collegamento. Questo componente è fisicamente alloggiato all'interno della scatola terminali del compressore con il foglio di istruzioni per l'uso.
- sensore; con attacco maschio M20 x 1.5 fissato, in fabbrica, all'attacco filettato del compressore.

Il sensore non ha parti mobili soggette ad avarie e, anche se viene rimosso il circuito di controllo, non permette la fuoriuscita di refrigerante.

ATTENZIONE

Il sensore è contatto diretto con zone in pressione della pompa di lubrificazione .

Per la sostituzione del circuito di controllo è necessario procedere come segue:

a) spegnere il compressore
b) rimuovere il coperchio della scatola terminali
c) rimuovere i conduttori del pressostato dal circuito di controllo e protezione del compressore
d) agendo sulla ghiera girevole, rimuovere il circuito di controllo dal sensore
e) avvitare accuratamente il nuovo circuito di controllo sul sensore
f) collegare i conduttori del pressostato agli appositi morsetti del circuito di controllo e protezione del compressore
g) rimontare il coperchio sulla scatola terminali
h) evacuare adeguatamente il compressore
i) aprire i rubinetti di compressione e aspirazione del compressore

If it is not possible to operate as previously described, it is necessary to proceed to the complete refrigerant charge recovery by a suitable recovery unit.

In this case it is suggested to adopt the following procedure:

- connect the recovery unit at two refrigerating circuit service connections, one placed on low pressure side and the other on high pressure side; the recovery will occur in more reduced times.
- during recovery, inside the evaporator and condenser, the pressure (and therefore the temperature) falls to very low values. To avoid the harmful ice formation inside the evaporators and water condensers, they have to be previously empted or keep costantly in function the circulation pumps till the recovery end
- during recovery, it is possible that from the refrigerating circuit, together with the refrigerant, it is removed also lubricant.

At recovery end, it is necessary to verify the quantity of lubricant that came out and, after ending the reparation intervention, put new lubricant in the

WARNING

Do not pollute the environment with lubricant; it is a special waste and it hase therefore to be carried off as per the regulations in force.

9.5 Oil pressure switch replacement

Electronic oil pressure switch fitting all Frascold compressors with oil pump mainly includes (see figure 16):

- control circuit; complete with fixing screw cap, reset push-button, LED signal lamp, cables. This component is located in to the terminal box of the compressor with instruction leaflet.
- sensor; M20 x 1.5 male threaded, mounted in factory to the pressure connection of the compressor.

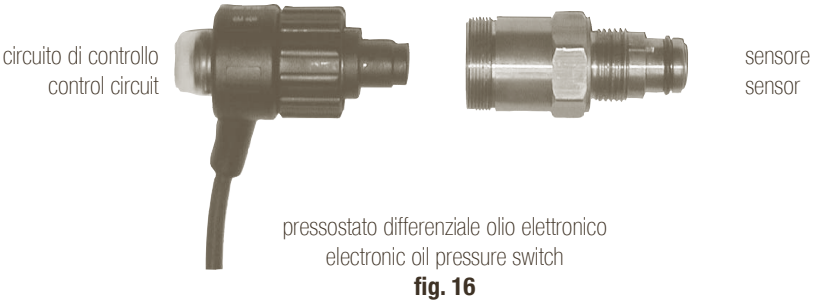
Sensor has no moving parts exposed to damages and no leakages can

WARNING

The sensor is in direct connection with pressure side of oil pump.

Apply following procedure to replace the broken control circuit:

a) switch off the compressor
b) remove the cover of terminal box
c) remove the cables of the oil pressure switch from the terminal board of the compressor
d) by means the screwcap, unscrew from the sensor the control circuit
e) put the new control circuit in to the sensor and close tightly by hand the screwcap
f) connect the cables of the pressure switch to the suitable terminal of the compressor terminal board
g) reassemble the cover on the terminal box



pressostato differenziale olio elettronico
electronic oil pressure switch

FTE001-03

10. Tabella diagnostica

Disfunzione accertata	Causa	Intervento suggerito
1. Pressione di scarico troppo bassa rispetto alla prevista pressione di condensazione.	**1.1** Insufficiente carica di refrigerante.	**1.1.1** Verificare la presenza di fughe di refrigerante ed eventualmente eliminarle, quindi ripristinare la carica ottimale.
	1.2 Temperatura del fluido di raffreddamento del condensatore eccessivamente bassa.	**1.2.1** Controllare la temperatura di ingresso al condensatore del fluido di raffreddamento e, eventualmente, intervenire per ridurne la portata.
	1.3 Imperfetta tenuta delle valvole a lamella del compressore.	**1.3.1** Collegare un manometro alla linea di aspirazione del compressore. La imperfetta tenuta delle valvole provoca un repentino aumento della pressione di aspirazione quando il compressore si arresta. In questo caso, riparare il compressore e rimuovere la causa di tale inconveniente.
	1.4 Notevole usura del compressore.	**1.4.1** Riparare o sostituire il compressore.
	1.5 Pressione di aspirazione troppo bassa rispetto alla pressione di evaporazione di progetto.	**1.5.1** Per gli interventi suggeriti, si rimanda alla disfunzione accertata 4. Pressione di aspirazione troppo bassa rispetto alla prevista pressione di evaporazione, con eventuale intervento del pressostato di bassa pressione.
2. Pressione di scarico troppo alta rispetto alla prevista pressione di condensazione con probabile intervento del dispositivo di protezione o del pressostato di alta pressione.	**2.1** Presenza di gas incondensabili all'interno del circuito frigorifero.	**2.1.1** Collegare un recuperatore di refrigerante sia al lato di alta che al lato di bassa pressione del circuito frigorifero e rimuovere l'intera carica di refrigerante. Evacuare a lungo il circuito, effettuare la ricarica con refrigerante nuovo, avviare il compressore e controllare le pressioni di lavoro.
	2.2 Linea di scarico parzialmente occlusa.	**2.2.1** Controllare che tutti i rubinetti sulla linea di scarico siano completamente aperti e che non ci siano restrizioni all'interno delle giunture (per esempio, eccessi di lega saldante).
	2.3 Condensatore in avaria o con insufficiente scambio termico.	**2.3.1** Confrontate le prestazioni del condensatore, dichiarate dal costruttore, con il bilancio termico di progetto; in caso di prestazioni insufficienti, sostituire il condensatore. **2.3.2** Se il condensatore è del tipo raffreddato ad aria, eseguire le seguenti operazioni: - controllare lo stato delle ventole del motoventilatore - controllare il senso di rotazione del motoventilatore - pulire il pacco alettato - raddrizzare le alette deformate Se il condensatore è del tipo raffreddato ad acqua, eseguire le seguenti operazioni: - disincrostare i tubi di alimentazione e il fascio tubiero - verificare l'efficienza della torre evaporativa - misurare la portata d'acqua - misurare la temperatura di ingresso dell'acqua
	2.4 Eccessiva carica di refrigerante.	**2.4.1** Collegare un recuperatore di refrigerante in un punto del circuito dove vi sia solo refrigerante liquido e recuperarne l'eccedenza. Terminate le operazioni di recupero, avviare il compressore e verificare le pressioni di lavoro.
	2.5 Pressione di aspirazione troppo elevata rispetto alla pressione di evaporazione di progetto.	**2.5.1** Controllare che il bulbo della valvola termostatica sia adeguatamente posizionato, fissato e coibentato. **2.5.2** Controllare che la capacità della valvola termostatica sia proporzionata alla reale capacità frigorifera del compressore e che la taratura del surriscaldamento sia corretta.

Disfunzione accertata	Causa	Intervento suggerito
		2.5.3 Se l'impianto è dotato di valvola limitatrice della pressione di aspirazione, verificarne la taratura.
3. Temperatura di scarico, misurata all'uscita del compressore, che supera il valore limite, con probabile intervento del dispositivo di protezione.	**3.1** Condensatore in avaria o con insufficiente scambio termico.	**3.1.1** Confrontate le prestazioni del condensatore, dichiarate dal costruttore, con il bilancio termico di progetto; in caso di prestazioni insufficienti, sostituire il condensatore. **3.1.2** Se il condensatore è del tipo raffreddato ad aria, eseguire le seguenti operazioni: - controllare lo stato delle ventole del motoventilatore - controllare il senso di rotazione del motoventilatore - pulire il pacco alettato - raddrizzare le alette deformate Se il condensatore è del tipo raffreddato ad acqua, eseguire le seguenti operazioni: - disincrostare i tubi di alimentazione e il fascio tubiero - verificare l'efficienza della torre evaporativa - misurare la portata d'acqua - misurare la temperatura di ingresso dell'acqua
	3.2 Presenza di gas incondensabili all'interno del circuito frigorifero.	**3.2.1** Collegare un recuperatore di refrigerante sia al lato di alta che al lato di bassa pressione del circuito frigorifero e rimuovere l'intera carica di refrigerante. Evacuare a lungo il circuito, effettuare la ricarica con refrigerante nuovo, avviare il compressore e controllare le pressioni di lavoro.
	3.3 Valvola termostatica sovraddimensionata.	**3.3.1** Sostituire la valvola termostatica o, se possibile, il solo orifizio.
	3.4 Bulbo della valvola termostatica non correttamente fissato alla linea di aspirazione.	**3.4.1** Fissare correttamente il bulbo utilizzando le apposite fascette metalliche fornite a corredo della valvola termostatica.
	3.5 Flusso di aria fredda che investe il bulbo della valvola termostatica.	**3.5.1** Rivestire con materiale coibente il bulbo della valvola termostatica e il tratto di linea di aspirazione sul quale è fissato.
	3.6 Eccessiva chiusura della valvola termostatica causata dalla errata taratura del surriscaldamento.	**3.6.1** Modificare la taratura della valvola termostatica in modo da ridurre il surriscaldamento.
	3.7 Valvola termostatica con elemento sensibile scarico.	**3.7.1** Sostituire la valvola termostatica o, se possibile, il solo elemento sensibile.
	3.8 Evaporatore eccessivamente brinato.	**3.8.1** Controllare il buon funzionamento dei dispositivi di sbrinamento. **3.8.2** Verificare che la quantità e le temperature del fluido raffreddato dall'evaporatore siano come da progetto.
	3.9 Linea di aspirazione con eccessive cadute di pressione.	**3.9.1** Controllare che tutti i rubinetti sulla linea di aspirazione siano completamente aperti. **3.9.2** Verificare l'efficienza di eventuali filtri installati sulla linea di aspirazione. **3.9.3** Se la linea di aspirazione è equipaggiata con valvola limitatrice, verificarne la taratura e la efficienza.
	3.10 Linea del liquido parzialmente occlusa.	**3.10.1** Controllare che tutti i rubinetti sulla linea del liquido siano completamente aperti e che non ci siano restrizioni all'interno delle giunture (per esempio, eccessi di lega saldante). **3.10.2** Verificare l'efficienza del filtro deidratore; una temperatura dell'attacco di uscita sensibilmente più bassa di quella dell'attacco di ingresso è provocata dalla sua
	3.11 Linea di scarico parzialmente occlusa.	

Disfunzione accertata	Causa	Intervento suggerito
		ostruzione anche parziale. In questo caso è necessario sostituire il filtro deidratore.
	3.12 Valvola termostatica sottodimensionata.	**3.11.1** Controllare che tutti i rubinetti sulla linea di scarico siano completamente aperti e che non ci siano restrizioni all'interno delle giunture (per esempio, eccessi di lega saldante).
	3.13 Insufficiente carica di refrigerante.	**3.12.1** Sostituire la valvola termostatica o, se possibile, il solo orifizio.
	3.14 Il fluido contenuto nell'elemento sensibile con carica MOP della valvola termostatica, è condensato nel soffietto.	**3.13.1** Verificare la presenza di fughe di refrigerante ed eventualmente eliminarle, quindi ripristinare la carica ottimale.
	3.15 Insufficiente isolamento della linea di aspirazione.	**3.14.1** Scaldare il soffietto (e la parte del corpo valvola adiacente) mediante un getto di aria moderatamente calda.
	3.16 Insufficiente lubrificazione del compressore.	**3.15.1** Sostituire l'isolamento o sostituirlo se danneggiato.
	3.17 Insufficiente raffreddamento del compressore.	**3.16.1** Controllare la qualità e il livello del lubrificante e ripristinarlo se necessario.
	3.18 Eccessivo numero di interventi orari del compressore.	**3.16.2** Verificare l'efficienza della pompa di lubrificazione e sostituirla se necessario.
	4.1 Insufficiente carica di refrigerante	**3.17.1** Verificare l'efficienza dei dispositivi per il raffreddamento supplementare del compressore.
	4.2 Linea del liquido parzialmente occlusa.	**3.17.2** Rimuovere gli eventuali ostacoli alla libera circolazione dell'aria attorno al compressore.
		3.18.1 Aumentare il differenziale del termostato di regolazione.
		4.1.1 Verificare la presenza di fughe di refrigerante ed eventualmente eliminarle, quindi ripristinare la carica ottimale.
		4.2.1 Controllare che tutti i rubinetti sulla linea del liquido siano completamente aperti e che non ci siano restrizioni all'interno delle giunture (per esempio, eccessi di lega saldante).
4. Pressione di aspirazione troppo bassa rispetto alla prevista pressione di evaporazione, con eventuale intervento del pressostato di bassa pressione.	**4.3** Linea di aspirazione con eccessive cadute di pressione.	**4.2.2** Verificare l'efficienza del filtro deidratore; una temperatura dell'attacco di uscita sensibilmente più bassa di quella dell'attacco di ingresso è provocata dalla sua ostruzione anche parziale. In questo caso è necessario sostituire il filtro deidratore.
	4.4 Eccessiva chiusura della valvola termostatica causata dalla errata taratura del surriscaldamento.	**4.3.1** Controllare che tutti i rubinetti sulla linea di aspirazione siano completamente aperti, verificare l'efficienza di eventuali filtri installati sulla linea di aspirazione.
	4.5 Il fluido contenuto nell'elemento sensibile con carica MOP della valvola termostatica, è condensato nel soffietto	**4.3.2** Se la linea di aspirazione è equipaggiata con valvola limitatrice, verificarne la taratura e la efficienza.
	4.6 Valvola termostatica con elemento sensibile scarico.	**4.4.1** Modificare la taratura della valvola termostatica in modo da ridurre il surriscaldamento.
	4.7 Valvola termostatica sottodimensionata.	**4.5.1** Scaldare il soffietto (e la parte del corpo valvola adiacente) mediante un getto d'aria moderatamente calda.
	4.8 Evaporatore eccessivamente brinato.	**4.6.1** Sostituire la valvola termostatica o, se possibile, il solo elemento sensibile.
		4.7.1 Sostituire la valvola termostatica, o, se possibile,

Disfunzione accertata	Causa	Intervento suggerito
		il solo orifizio.
5. Pressione di aspirazione troppo alta rispetto alla prevista pressione di evaporazione, con eventuale intervento del dispositivo di protezione e probabile brinatura parziale del compressore.	**5.1** Valvola termostatica sovraddimensionata.	**4.8.1** Controllare il buon funzionamento dei dispositivi di sbrinamento.
	5.2 Eccessiva apertura della valvola termostatica causata dalla errata taratura del surriscaldamento.	**4.8.2** verificare che la quantità e le temperature del fluido raffreddato dall'evaporatore siano come da progetto.
	5.3 Bulbo della valvola termostatica non correttamente fissato alla linea di aspirazione.	
	5.4 Flusso di aria fredda che investe il bulbo della valvola termostatica.	**5.1.1** Sostituire la valvola termostatica o, se possibile, il solo orifizio.
	5.5 Errata taratura della valvola limitatrice della pressione di aspirazione.	**5.2.1** Modificare la taratura della valvola termostatica in modo da aumentare il surriscaldamento.
		5.3.1 Fissare correttamente il bulbo utilizzando le apposite fascette metalliche fornite a corredo della valvola termostatica.
6. Il compressore dotato di pompa di lubrificazione, si ferma per intervento del pressostato differenziale olio.	**6.1** Pompa di lubrificazione inefficiente o in avaria.	**5.4.1** Rivestire con materiale coibente il bulbo della valvola termostatica e il tratto di linea di aspirazione sul quale è fissato.
	6.2 Pressostato differenziale olio non correttamente tarato o in avaria.	**5.5.1** Mediante un manometro collegato alla aspirazione del compressore, verificare la taratura della valvola limitatrice.
	6.3 Per le cause, si rimanda alla disfunzione accertata "7. Livello del lubrificante nel carter del compressore inferiore al previsto".	**6.1.1** Collegare un manometro per olio all'attacco di mandata della pompa, avviare il compressore e confrontare il valore di pressione letto con quello indicato nel presente manuale.
7. Il livello del lubrificante nel carter del compressore è inferiore al previsto.	**7.1** Circuito frigorifero con perdite di refrigerante.	**6.2.1** Verificare la taratura del pressostato differenziale olio e, se necessario, sostituirlo.
	7.2 Separatore d'olio in avaria.	**6.3.1** Per gli interventi suggeriti, si rimanda alla disfunzione accertata "7. Livello del lubrificante nel carter del compressore inferiore al previsto".
	7.3 Il lubrificante fuoriuscito dal compressore durante il funzionamento è rimasto intrappolato nel circuito frigorifero.	**7.1.1** Per mezzo di un cercafughe elettronico, individuare i punti di perdita ed eliminarli, quindi ripristinare la carica ottimale.
		7.2.1 Riparare o sostituire il separatore di olio.
	7.4 La presenza di refrigerante liquido nel carter del compressore, al momento del suo avviamento, ha favorito la schiumatura del lubrificante che è stato aspirato e mandato in circolazione.	**7.3.1** Il mancato ritorno di lubrificante è generalmente causato da un notevole abbassamento della velocità del refrigerante e, conseguentemente della sua pressione. Per gli interventi suggeriti, si rimanda alla disfunzione accertata "4. Pressione di aspirazione troppo bassa rispetto alla prevista pressione di evaporazione, con eventuale intervento del pressostato di bassa pressione".
		7.4.1 Verificare l'efficienza del riscaldatore olio carter, se necessario sostituirlo e se mancante, provvedere alla sua installazione.
8. Periodi di arresto del compressore troppo brevi, oppure il compressore effettua più di sei interventi all'ora.	**8.1** Forti rientri di calore nella zona refrigerata.	**7.4.2** Il ritorno di refrigerante liquido è da addebitare anche a una pressione di aspirazione troppo elevata rispetto alla prevista pressione di evaporazione. Per gli interventi suggeriti, si rimanda alla disfunzione accertata "5. Pressione di aspirazione troppo alta rispetto alla prevista pressione di evaporazione, con eventuale intervento del dispositivo di protezione e probabile brinatura parziale del compressore".
	8.2 Termostato di regolazione con differenziale troppo ristretto.	
	8.3 Imperfetta tenuta delle valvole a lamella del compressore.	**8.1.1** Verificare la tenuta delle porte isotermiche della cella frigorifera e di tutti gli accessi in generale.

Disfunzione accertata	Causa	Intervento suggerito
9. Il compressore si ferma per intervento del dispositivo di protezione.	**9.1** Presenza di gas incondensabili all'interno del circuito frigorifero.	**8.2.1** Aumentare il differenziale del termostato di regolazione. **8.3.1** Collegare un manometro alla linea di aspirazione del compressore. La imperfetta tenuta delle valvole provoca un repentino aumento della pressione di aspirazione quando il compressore si arresta. In questo caso, riparare il compressore e rimuovere la causa di tale inconveniente.
	9.2 Carica di refrigerante eccessiva.	**9.1.1** Collegare un recuperatore di refrigerante sia al lato di alta che al lato di bassa pressione del circuito frigorifero e rimuovere l'intera carica di refrigerante. Evacuare a lungo il circuito, effettuare la ricarica con refrigerante nuovo, avviare il compressore e controllare le pressioni di lavoro.
	9.3 Condensatore in avaria o con insufficiente scambio termico.	**9.2.1** Collegare il recuperatore di refrigerante in un punto del circuito dove vi sia solo refrigerante liquido e recuperarne l'eccedenza. Terminate le operazioni di recupero, avviare il compressore e verificare le pressioni di lavoro. **9.3.1** Confrontate le prestazioni del condensatore, dichiarate dal costruttore, con il bilancio termico di progetto; in caso di prestazioni insufficienti, sostituire il condensatore. **9.3.2** Se il condensatore è del tipo raffreddato ad aria, eseguire le seguenti operazioni: - controllare lo stato delle ventole del motoventilatore - controllare il senso di rotazione del motoventilatore - pulire il pacco alettato - raddrizzare le alette deformate Se il condensatore è del tipo raffreddato ad acqua, eseguire le seguenti operazioni: - disincrostare i tubi di alimentazione e il fascio tubiero - verificare l'efficienza della torre evaporativa - misurare la portata d'acqua - misurare la temperatura di ingresso dell'acqua.
	9.4 Condensatore raffreddato ad aria con ricircolo di aria calda.	**9.4.1** Verificare che la dislocazione del condensatore sia tale da impedire al flusso d'aria in uscita di essere, anche parzialmente, deviato sulla aspirazione del ventilatore.
	9.5 Linea di scarico parzialmente occlusa.	**9.5.1** Controllare che tutti i rubinetti sulla linea di scarico siano completamente aperti e che non ci siano restrizioni all'interno delle giunture (per esempio, eccessi di lega saldante).
	9.6 Pressione di aspirazione troppo elevata rispetto alla pressione di evaporazione di progetto.	**9.6.1** Controllare che il bulbo della valvola termostatica sia adeguatamente posizionato, fissato e coibentato. **9.6.2** Controllare che la capacità della valvola termostatica sia proporzionata alla reale capacità frigorifera del compressore e che la taratura del surriscaldamento sia corretta. **9.6.3** Se l'impianto è dotato di valvola limitatrice della pressione di aspirazione, verificarne la taratura.
	9.7 Tensione della rete di alimentazione inferiore ai limiti di tolleranza del motore elettrico del compressore.	**9.7.1** Misurare la tensione tra le fasi della linea di alimentazione. Se la tensione misurata è nei limiti ma diminuisce mentre il compressore funziona, la disfunzione è da imputare alla insufficiente sezione della linea di alimentazione; in questo caso, sostituire la linea di alimentazione con una di sezione adeguata.
	9.8 Motore elettrico con avvolgimento a massa oppure in corto circuito.	**9.8.1** Verificare la resistenza degli avvolgimenti, la rigidità dielettrica (isolamento verso massa); provvedere alla riparazione o sostituzione del compressore.
	9.9 Linea di alimentazione elettrica trifase sbilanciata.	**9.9.1** Controllare la tensione tra le fasi, se sbilanciata chiedere l'intervento dell'ente erogatore.
	9.10 Dispositivo di protezione difettoso o con taratura errata.	

FTEC01-03

Disfunzione accertata	Causa	Intervento suggerito
	9.11 Collegamenti elettrici errati.	**9.10.1** Misurare i valori delle correnti allo spunto, in marcia e la temperatura del compressore. Se i valori misurati evidenziano assenza di sovraccarichi e di surriscaldamento del compressore: - per i compressori trifase verificare la continuità e la resistenza della catena dei termistori - per i compressori monofase verificare che alla temperatura ambiente il protettore elettrotermico sia chiuso.
	9.12 Relais di avviamento montato non correttamente.	**9.11.1** Ripristinare i collegamenti facendo riferimento agli schemi elettrici del presente manuale.
	9.13 Eccessiva temperatura del compressore.	**9.12.1** Verificare che il relais sia stato collegato come indicato negli schemi elettrici del presente manuale.
	9.14 Principio di grippaggio oppure accoppiamenti albero-bronzine e/o pistone-cilindro non sufficientemente scorrevoli.	**9.13.1** Verificare l'efficienza del raffreddamento supplementare del compressore (motoventilatore sulle testate, testate raffreddate ad acqua, iniezione di liquido) e che la sua superficie esterna sia pulita e libera.
10. Il compressore monofase non si avvia, ronza a intermittenza e ciclicamente interviene la protezione elettrotermica.	**10.1** Collegamenti elettrici errati.	**9.14.1** Provvedere alla riparazione o sostituzione del compressore.
	10.2 Alimentazione elettrica con tensione inferiore ai limiti di tolleranza.	**10.1.1** Ripristinare i collegamenti facendo riferimento agli schemi elettrici del presente manuale.
	10.3 Carica di refrigerante eccessiva.	**10.2.1** Misurare la tensione della linea di alimentazione mentre il compressore si avvia. Se la tensione diminuisce mentre il compressore ronza ma non si avvia, la disfunzione è da imputare alla insufficiente sezione della linea di alimentazione; in questo caso, sostituire la linea di alimentazione con una di sezione adeguata.
	10.4 Relais di avviamento difettoso o non adatto.	**10.3.1** Collegare un recuperatore di refrigerante in un punto del circuito dove vi sia solo refrigerante liquido e recuperarne l'eccedenza, quindi avviare il compressore e verificare le pressioni di lavoro.
	10.5 Blocco meccanico del compressore.	**10.4.1** Sostituire il relais con uno nuovo.
	10.6 Avvolgimento del motore elettrico difettoso.	**10.5.1** Mediante un collegamento elettrico provvisorio, dare al motore elettrico del compressore un impulso tendente a farlo girare in senso inverso al precedente. Nel caso il tentativo non avesse esito positivo, riparare o sostituire il compressore.
	10.7 Dispositivo di protezione difettoso.	**10.6.1** Scollegare il compressore dalla rete di alimentazione elettrica, rimuovere i conduttori dalla morsettiera e, mediante un ohmetro, verificare se i valori di resistenza degli avvolgimenti sono corretti. Riparare o sostituire il compressore se necessario.
		10.6.2 Verificare la rigidità dielettrica del compressore (isolamento verso massa). Riparare o sostituire il compressore se necessario.
	10.8 Condensatore di avviamento difettoso o con tensione di targa inferiore a quella prescritta.	**10.7.1** Misurare i valori delle correnti allo spunto, in marcia e la temperatura del compressore. Se i valori misurati evidenziano assenza di sovraccarichi e di surriscaldamento del compressore: - per i compressori trifase verificare la continuità e la resistenza della catena dei termistori - per i compressori monofase verificare che alla temperatura ambiente il protettore elettrotermico sia chiuso.
	10.9 Condensatore di marcia difettoso.	**10.8.1** Sostituire il condensatore di avviamento.
11. Il compressore trifase non si avvia, ronza a intermittenza e ciclicamente interviene il modulo di protezione (o analogo dispositivo predisposto dall'installatore).	**11.1** Rete di alimentazione elettrica con tensione inferiore ai limiti di tolleranza.	

FTE001-03

Disfunzione accertata	Causa	Intervento suggerito
		10.9.1 Sostituire il condensatore di marcia.
	11.2 Mancanza di una delle tre fasi di alimentazione.	**11.1.1** Verificare la tensione di ognuna delle fasi mentre il compressore si avvia. Se la tensione diminuisce mentre il compressore ronza ma non si avvia, la disfunzione è da imputare alla insufficiente sezione della linea di alimentazione.
	11.3 Dispositivo di protezione difettoso o non correttamente tarato.	**11.2.1** Partendo dalla morsettiera del compressore e risalendo lungo la linea di alimentazione, verificare la tensione tra le tre fasi. La mancanza di una fase può essere dovuta a morsetti allentati, usura dei contatti del teleruttore, fusibile interrotto, etc.
	11.4 Avvolgimento del motore elettrico interrotto.	**11.3.1** Misurare i valori delle correnti allo spunto, in marcia e la temperatura del compressore. Se i valori misurati evidenziano assenza di sovraccarichi e di surriscaldamento del compressore, verificare la continuità e la resistenza della catena dei termistori e se necessario sostituire il compressore.
	11.5 Blocco meccanico del compressore.	
	11.6 Motore elettrico con avvolgimento a massa.	**11.4.1** Scollegare il compressore dalla rete di alimentazione elettrica, rimuovere i conduttori dalla morsettiera e, mediante un ohmetro, verificare se i valori di resistenza degli avvolgimenti sono corretti. Riparare o sostituire il compressore se necessario.
12. Il compressore non si avvia e non ronza anche se il quadro di comando è regolarmente		
	12.1 Interruttore della linea di alimentazione elettrica.	**11.5.1** Riparare o sostituire il compressore.
	12.2 Elemento sensibile del termostato scarico.	**11.6.1** Verificare la rigidità dielettrica del compressore (isolamento verso massa). Riparare o sostituire il compressore se necessario.
	12.3 Bobina del teleruttore in avaria.	
	12.4 Intervento di un dispositivo di sicurezza con dispositivo di reinserzione manuale	**12.1.1** Verificare la continuità della linea di alimentazione elettrica.
	12.5 Motore elettrico del compressore con avvolgimento interrotto.	**12.2.1** Sostituire il termostato.
13. Rapida usura dei contatti del relais di avviamento.		**12.3.1** Sostituire la bobina del teleruttore
	13.1 Eccessivo numero di interventi orari del compressore.	**12.4.1** Rimuovere la causa dell'intervento, quindi

ATTENZIONE

FTEC01-03

10. Troubleshooting

Established failure	Cause	Suggested remedy
1. Too low discharge pressure with respect to the previous condensing pressure.	**1.1** Insufficient refrigerant charge.	**1.1.1** Verify the refrigerant leaks and eventually eliminate them, restore therefore the optimal charge.
	1.2 Excessive low condenser cooling fluid temperature.	**1.2.1** Check the cooling fluid entry temperature to condenser and, eventually, intervene to reduce the capacity.
	1.3 Imperfect compressor reed valve sealing.	**1.3.1** Connect a gauge to the compressor suction line. The imperfect valve sealing causes a sudden suction pressure increase when the compressor stops. In this case, repair the compressor and remove the cause of this inconvenience.
	1.4 High compressor wear.	**1.4.1** Repair or replace the compressor.
	1.5 Too low suction pressure with respect to the designed evaporating pressure.	**1.5.1** For the suggested interventions, it refers to the established failure 4. Too low suction pressure with respect to the foreseen evaporating pressure, with eventual low pressure switch intervention.
2. Too high discharge pressure with respect to the foreseen condensing pressure with probable intervention of the protection device or of the high pressure switch.	**2.1** Incondensable gas inside the refrigerating circuit.	**2.1.1** Connect a refrigerant recovery unit both to refrigerating circuit high pressure side and to low pressure side and remove the whole refrigerant charge. Evacuate for a long time the circuit, effect the recharge with new refrigerant, start the compressor and check the working pressures.
	2.2 Partially obstructed discharge line.	**2.2.1** Check that all discharge line valves are completely open and that there are no restrictions inside the joints (for example, solder alloy excesses).
	2.3 Condenser failure or with insufficient thermal exchange.	**2.3.1** Compare the condenser performances, declared by manufacturer, with the designed heat balance; in case of insufficient performances, replace the condenser. **2.3.2** If the condenser is air-cooled, execute the following operations: - check the fan motor fans state - check the fan motor direction of rotation - clean the finned coil - rectify any distorted fins. If the condenser is water-cooled, execute the following operations: - descale the feeding pipes and the tube bundle - verify the evaporating tower efficiency - measure the water capacity - measure the water entry temperature.
	2.4 Excessive refrigerant charge.	**2.4.1** Connect a refrigerant recovery unit in a circuit point, where there is only liquid refrigerant and recover the excess. At the end of recovery operations, start the compressor and verify the working pressures.
	2.5 Too high suction pressure with respect to the designed evaporating pressure.	**2.5.1** Check that the thermostatic expansion valve bulb is suitably placed, fixed and insulated. **2.5.2** Check that the thermostatic expansion valve capacity is proportional to the real compressor refrigerating capacity and that the superheat setting is correct. **2.5.3** If the plant is equipped with suction pressure regulating valve, verify the calibration.
3. Discharge temperature, measured at compressor discharge, which exceeds the limit value, with probable protection device intervention.	**3.1** Condenser failure or with insufficient thermal exchange.	**3.1.1** Compare the condenser performances, declared by manufacturer, with the designed heat balance; in case of insufficient performances, replace the condenser. **3.1.2** If the condenser is air-cooled, perform the

FTE001-03

Established failure	Cause	Suggested remedy
		following operations: - check the fan motor fans state - check the fan motor direction of rotation - clean the finned coil - rectify any distorted fins If the condenser is water-cooled, perform the following operations: - descale the feeding pipes and the tube bundle - verify the evaporating tower efficiency - measure the water capacity - measure the water entry temperature.
	3.2 Incondensable gas inside the refrigerating circuit.	**3.2.1** Connect a refrigerant recovery unit both to refrigerating circuit high pressure side and to low pressure side and remove the whole refrigerant charge. Evacuate for a long time the circuit, effect the recharge with new refrigerant, start the compressor and check the working pressures.
	3.3 Overdimensioned thermostatic expansion valve.	**3.3.1** Replace the thermostatic expansion valve or, if possible, only the orifice.
	3.4 Thermostatic expansion valve bulb, which incorrectly fixed to the suction line.	**3.4.1** Fix correctly the bulb, using the suitable metallic clamps supplied as spares of the thermostatic expansion valve.
	3.5 Cold air flow that wraps the thermostatic expansion valve bulb.	**3.5.1** Line with insulating material the thermostatic expansion valve bulb and the suction line section, on which it is fixed.
	3.6 Excessive thermostatic expansion valve closing, due to wrong superheat setting.	**3.6.1** Modify the thermostatic expansion valve setting in order to reduce superheat.
	3.7 Thermostatic expansion valve with discharge bellow.	**3.7.1** Replace the thermostatic expansion valve or, if possible, only the sensible element.
	3.8 Excessive frosted evaporator.	**3.8.1** Check the defrosting devices in good working order.
		3.8.2 Verify that the quantity and temperatures of the fluid cooled from evaporator are as designed.
	3.9 Suction line with excessive pressure drops.	**3.9.1** Check that all suction line valves are completely open.
		3.9.2 Verify the efficiency of any filters, installed in suction line.
		3.9.3 If the suction line is equipped with pressure relief valve, verify the calibration and efficiency.
	3.10 Partially obstructed liquid line.	**3.10.1** Check that all liquid line valves are completely open and that there are no restrictions inside the joints (for example, solder alloy excesses).
		3.10.2 Verify the dryer filter efficiency; an exit connection temperature lower than the entry connection temperature is caused by its obstruction, also partial. In this case, it is necessary to replace the dryer filter.
	3.11 Partially obstructed discharge line.	**3.11.1** Check that all discharge line valves are completely open and that there are no restrictions inside the joints (for example, solder alloy excesses).
	3.12 Underdimensioned thermostatic expansion valve.	**3.12.1** Replace the thermostatic expansion valve or, if possible, only the orifice.
	3.13 Insufficient refrigerant charge.	**3.13.1** Verify the refrigerant leaks and eventually eliminate them, restore therefore the optimal charge.
		3.14.1 Heat the bellows (and the adjacent valve body

FTEC01-03

Established failure	Cause	Suggested remedy
		part) twith warm air flow.
	3.14 The fluid inside the thermostatic expansion valve sensor element with MOP charge, is condensed in the bellows.	**3.15.1** Replace the insulation or replace it if it is damaged.
	3.15 Insufficient suction line insulation.	**3.16.1** Check the lubricant quantity and level and restore it if necessary.
	3.16 Insufficient compressor lubrication.	**3.16.2** Verify the lubricating pump efficiency and replace it if necessary.
		3.17.1 Verify efficiency of the compressor's additional cooling devices.
	3.17 Insufficient compressor cooling.	**3.17.2** Remove any restriction for the free air circulation around the compressor.
		3.18.1 Increase the regulating thermostat differential.
4. Too low suction pressure with respect to the foreseen evaporating pressure, with eventual low pressure switch intervention.	**3.18** Excessive compressor cycling.	**4.1.1** Verify the refrigerant leaks and eventually eliminate them, restore therefore the optimal charge.
	4.1 Insufficient refrigerant charge.	**4.2.1** Check that all liquid line valves are completely open and that there are not restrictions inside the joints (for example, solder alloy excesses).
	4.2 Partially obstructed liquid line.	**4.2.2** Verify the dryer filter efficiency; an exit connection temperature lower than the entry connection temperature is caused by its obstruction, also partial. In this case, it is necessary to replace the dryer filter.
		4.3.1 Check that all suction line valves are completely open. Verify the efficiency any filters, installed in suction line.
	4.3 Suction line with excessive pressure falls.	**4.3.2** If the suction line is equipped with pressure relief valve, verify the calibration and efficiency.
		4.4.1 Modify the thermostatic expansion valve calibration in order to reduce superheat.
	4.4 Excessive thermostatic expansion valve closing, due to wrong superheat setting.	**4.5.1** Heat the bellows (and the adjacent valve body part) with warm air flow.
	4.5 The fluid inside the thermostatic expansion valve sensor element with MOP charge is condensed in the bellows.	**4.6.1** Replace the thermal expansion valve or, if possible, only the sensor element.
	4.6 Thermostatic expansion valve with discharge sensible element.	**4.7.1** Replace the thermal expansion valve or,if possible, only the orifice.
	4.7 Underdimensioned thermostatic expansion valve.	**4.8.1** Check the defrosting device good working.
	4.8 Excessive frozed evaporator.	**4.8.2** Verify that the quantity and temperatures of the fluid cooled from evaporator are like design.
5. Too high suction pressure with respect to the foreseen evaporating pressure, with eventual protection device intervention and probable partial compressor freezing.		**5.1.1** Replace the thermal expansion valve or, if possible, only the orifice.
	5.1 Overdimensioned thermostatic expansion valve.	**5.2.1** Modify the thermostatic expansion valve calibration in order to increase the superheat.
	5.2 Excessive thermostatic expansion valve opening, due to wrong superheat setting.	**5.3.1** Fix correctly the bulb, using the suitable metallic clamps supplied as spares of thermostatic expansion valve.
	5.3 Thermostatic expansion valve bulb which is incorrectly fixed to the suction line.	**5.4.1** Line with insulating material the thermostatic expansion valve bulb and the suction line section, on which it is fixed.
	5.4 Cold air flow, which wraps the thermostatic	**5.5.1** Throug a gauge connected to the compressor

FTE001-03

Established failure	Cause	Suggested remedy
	expansion valve bulb.	suction, verify the pressure regulating valve calibration.
6. The compressor equipped with lubricating pump, stops for oil pressure switch intervention.	**5.5** Wrong suction pressure regulating valve calibration.	**6.1.1** Connect an oil gauge to the pump discharge connection, start the compressor and compare the read pressure value with the one indicated in the present manual.
	6.1 Inefficient or failured lubricating pump.	**6.2.1** Verify the oil pressure switch calibration and, if necessary, replace it.
	6.2 Oil pressure switch that is wrong calibrated or on failure.	**6.3.1** For the suggested interventions, we refer to the established failure "7.Lubricant lever in the compressor crankcase lower than the one foreseen".
7. The lubricant level in the compressor crankcase is lower than the one foreseen.	**6.3** For the causes, we refer to the established failure "7.Lubricant level in the compressor crankcase lower than the one foreseen".	**7.1.1** Through an electronic leak detector, find the leakage points and eliminate them, restore therefore the optimal charge.
	7.1 Refrigerant circuit with refrigerant leaks.	**7.2.1** Repair or replace the oil separator.
	7.2 Failured oil separator.	**7.3.1** The missed lubricant return is generally caused by a considerable drop of the refrigerant speed and, consequently, of its pressure. For the suggested interventions, we refer to the established failure "4.Too low suction pressure with respect to the foreseen evaporating pressure, with eventual low pressure switch intervention".
	7.3 The lubricant is pumped out from the compressor during working, remains trapped in the refrigerating circuit.	**7.4.1** Verify the oil crankcase heater efficiency, if necessary replace it and, if it is missing, install it.
	7.4 The liquid refrigerant in the compressor crankcase, on start-up has foamed in the oil causing the oil to be pumped into system.	**7.4.2** The liquid refrigerant return is to charged also at a suction pressure that is too high with respect to the foreseen evaporating pressure. For the suggested interventions, we refer to the established failure "5.Too high suction pressure with respect to the foreseen evaporating pressure, with eventual protection device intervention and probable partial compressor frozing".
8. Too short compressor stop periods, or the compressor effects more of six interventions per hour.		**8.1.1** Verify the sealing of refrigerating room isothermal doors and of all accessories.
	8.1 Strong heat re-enters in the refrigerated area.	**8.2.1** Increase the regulating thermostat differential.
	8.2 Regulating thermostat with too small differential.	**8.3.1** Connect a manometer to the compressor suction line. The imperfect valve sealing causes a sudden suction pressure increase when the compressor stops. In this case, repair the compressor and remove the cause of this inconvenience.
	8.3 Imperfect compressor reed valve sealing.	
9. The compressor stops for protection device intervention.		**9.1.1** Connect a refrigerant recovery unit both to refrigerating circuit high pressure side and to low pressure side and remove the whole refrigerant charge. Evacuate for a long time the circuit, effect the recharge with new refrigerant, start the compressor and check the working pressures.
	9.1 Incondensable gas inside the refrigerating circuit.	**9.2.1** Connect a refrigerant recovery unit in a circuit point, where there is only liquid refrigerant and recover the excess. At the end of recovery operations, start the compressor and verify the working pressures.
	9.2 Excessive refrigerant charge.	**9.3.1** Compare the condenser performances, declared by manufacturer, with the designed heat balance; in case the performaces are insufficient, replace the condenser.
	9.3 Condenser on failure or with insufficient thermal exchange.	**9.3.2** If the condenser is air-cooled, execute the

FTEC01-03

Established failure	Cause	Suggested remedy
		following operations: - check the fan motor fans state - check the fan motor direction of rotation - clean the finned coil - rectify any distorted fins. If the condenser is water-cooled, execute the following operations: - scale the feeding pipes and the tube nest - verify the cooling tower efficiency - measure the water capacity - measure the water inlet temperature
		9.4.1 Verify that the condenser location is in such way to avoid at the outlet air flow to be, also partially, deviated on the fan suction.
	9.4 Air-cooled condenser with hot air blow-by.	**9.5.1** Check that all liquid line valves are completely open and that there are not restrictions inside the joints (for example, solder alloy excesses).
	9.5 Partially obstructed discharge line.	**9.6.1** Check that the thermostatic expansion valve bulb is suitably positioned, fixed and insulated.
	9.6 Too high suction pressure with respect to the designed evaporating pressure.	**9.6.2** Check that the thermostatic expansion valve capacity is proportional to the real compressor refrigerating capacity and that the superheat setting is correct.
		9.6.3 If the plant is equipped with suction pressure relief valve, verify the calibration.
		9.7.1 Measure the tension between the feeding line phases. If the measured tension is within the limits, but it decreases during compressor working, the failure is to charge to the insufficient feeding line section; in this case, replace the feeding line with one of suitable section.
	9.7 Feeding net tension lower than the compressor electrical motor tolerance limits.	**9.8.1** Verify the wiring strength, the dielectric rigidity (insulation towards earth); repair or replace the compressor.
	9.8 Electrical motor with earthed or in short circuit wiring.	**9.9.1** Check the tension between phases; if it is unbalanced, ask for output institution intervention.
	9.9 Unbalanced three-phase electrical feeding line.	**9.10.1** Measure values of start, run currents and of the compressor temperature. If the measured values shows compressor overloads and overheating absence: - for three phase compressors verify the thermistor chain continuity and strength - or single phase compressors verify that at ambient temperature, theelectrothermal protector is closed.
	9.10 Defective protection device or with wrong calibration.	**9.11.1** Restore the connections, referring to the electrical schemes of the present manual.
	9.11 Wrong electrical connections.	**9.12.1** Verify that the relay has been connected as indicated in the electrical schemes of the present manual.
	9.12 Starting relay wrong mounted.	**9.13.1** Verify the compressor additional cooling efficiency (head fan motors, water-cooled heads, liquid injection) and that its external surface is clean and free.
	9.13 Excessive compressor temperature.	**9.14.1** Repair or replace the compressor.
10. The single phase compressor doesn't start, hums intermittently and cyclical intervens the electrothermal protection.	**9.14** Seizure starting or shaft-bearings and/or piston-cylinder couplings,which are not sufficiently sliding.	**10.1.1** Restore the connections, referring to the electrical wiring of the present manual.
	10.1 Wrong electrical connections.	**10.2.1** Measure the feeding line tension while the
